## Jamo Combining Operations

```

120 % JAMO COMBINING OPERATIONS
121
122 % calling convention: hangul macros generally take a final set of
123 % parentheses containing a vowel ID and two transforms, ixf and oxf.
124 % The ixf transform will transform the (50,50) to (950,850) square into
125 % where the jamo (or combination thereof) should be placed. The oxf
126 % transform transforms that same square into a possibly-larger space
127 % representing limits created by adjacent jamo; this allows for parts
128 % of jamo that may extend into the adjacent jamo's space conditionally
129 % on the shape of the adjacent jamo.
130 %
131 % The "id" family of arguments are jamo IDs pointing into the hangul.jamo
132 % tables.
133
134 vardef hangul.combine.lr(expr lid,rid)(expr vow,ixf,oxf) =

```

PLEASE NOTE: The files jieub-ac.mp through jieub-d6.mp are algorithmically generated, and identical except for the four variable assignments defining the start of each file's coverage range. The file jieub-d7.mp is similar, but also includes hglxtb.mp. They define a total of 11172 glyphs for precomposed hangul syllables, which all consist of the same few jamo in systematically varying arrangements. It seems that generating a proof page for every one of these files and glyphs would not be a good use of resources. Instead, we give an example of one MetaPost file above, and on the following pages, detailed proofs for 28 syllable glyphs covering at least one example of every lead, vowel, and tail jamo. After that is a table of all the precomposed syllables printed 480 per page.
