Package 'SemNeT'

November 3, 2025

```
Title Methods and Measures for Semantic Network Analysis
Version 1.4.5
Date 2025-11-03
Maintainer Alexander P. Christensen <alexpaulchristensen@gmail.com>
Description Implements several functions for the analysis of semantic networks including differ-
     ent network estimation algorithms, partial node bootstrap-
     ping (Kenett, Anaki, & Faust, 2014 <doi:10.3389/fnhum.2014.00407>), random walk simula-
     tion (Kenett & Austerweil, 2016 < http:
     //alab.psych.wisc.edu/papers/files/Kenett16CreativityRW.pdf>), and a func-
     tion to compute global network measures. Significance tests and plotting features are also imple-
     mented.

Description

Index

Implements several functions for the analysis of semantic networks including partial node bootstraping (Kenett, Anaki, & Faust, 2014), random walk simulation (Kenett & Austerweil, 2016), and a function to compute global network measures. Significance tests and plotting features are also implemented.

animals.freq 3

animals.freq

Frequency of Animal Responses

Description

Frequency of animal responses from Christensen & Kenett (2019). These frequencies are used to generate data in the sim.fluency function.

Usage

```
data(animals.freq)
```

Format

```
animals.freq (vector, length = 367)
```

```
data("animals.freq")
```

4 ASPL

ASPL

Average Shortest Path Length

Description

Computes the global average shortest path length of the network

Usage

```
ASPL(A, weighted = FALSE)
```

Arguments

A An adjacency matrix of network data

Value

Returns the ASPL of the network

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

References

Rubinov, M., & Sporns, O. (2010). Complex network measures of brain connectivity: Uses and interpretations. *NeuroImage*, 52, 1059-1069.

```
# Pearson's correlation only for CRAN checks
A <- TMFG(similarity(sim.fluency(100), method = "cor"))
# Unweighted
aspl <- ASPL(A)</pre>
```

bootSemNeT 5

bootSemNeT

Bootstrapped Semantic Network Analysis

Description

Bootstrap techniques to generate semantic networks and compute global network characteristics

Usage

```
bootSemNeT(
    ...,
    method = c("CN", "NRW", "PF", "TMFG"),
    methodArgs = list(),
    type = c("case", "node"),
    prop = 0.5,
    sim,
    weighted = FALSE,
    iter = 1000,
    cores
)
```

Arguments

... Matrices or data frames. Cleaned response matrices (e.g., responses\$clean from textcleaner) or binary response matrices (e.g., binary output from textcleaner)

method Character. Network estimation method to use. Current options include:

- TMFG Triangulated Maximally Filtered Graph
- CN Community Network
- NRW Naive Random Walk
- PF Pathfinder

methodArgs

List. A list of additional arguments for the network estimation function. See links in argument method for additional arguments (see also Examples)

type

Character. Type of bootstrap to perform

- node Generates partial networks based on dropping a certain proportion of nodes (see argument prop)
- case —Samples with replacement the same number of participants as in the original dataset

prop

Numeric. **Only** for type = "node". Proportion of nodes to remain in the network. Defaults to .50

sim

Character. Similarity measure to use. Defaults to "cosine". See similarity for other options

weighted

Boolean. Should weighted ASPL and CC be used? Defaults to FALSE. Set to TRUE for weighted ASPL and CC $\,$

6 bootSemNeT

iter	Numeric. Number of iterations in bootstrap. Defaults to 1000	
cores	Numeric. Number of computer processing cores to use for bootstrapping sam-	
	ples. Defaults to $n/2$ total number of cores. Set to any number between 1 and	
	maximum amount of cores on your computer (see parellel::detectCores())	

Value

Returns a list containing:

dataMeas A matrix for the network input in the data argument, where columns are the

semantic network measures from semnetmeas and rows are their values from each bootstrapped sample (results in a matrix with the dimensions iter by 3)

dataSumm Summary statistics across the bootrapped samples for the network input in the

data argument

prop Outputs the proportion used from the prop argument

iter Outputs the number of bootstrapped samples used from the iter argument

If a paired network is input, then also returns:

pairedMeas A matrix for the network input in the paired argument, where columns are the

semantic network measures from semnetmeas and rows are their values from each bootstrapped sample (results in a matrix with the dimensions iter by 3)

pairedSumm Summary statistics across the bootrapped samples for the network input in the

paired argument

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

```
# Simulate Dataset
one <- sim.fluency(20)

# Run bootstrap node-drop (partial) networks
one.result <- bootSemNeT(one, prop = .50, iter = 100,
sim = "cosine", cores = 2, method = "TMFG", type = "node")

# Run bootstrap case-drop networks
## Includes additional equating argument: minCase
one.result <- bootSemNeT(one, iter = 100, sim = "cosine",
cores = 2, method = "TMFG", type = "case", methodArgs = list(minCase = 2))

# Bootstrap case-wise networks
## Get openness data
low <- open.clean[which(open.group == "Low"),]
high <- open.clean[which(open.group == "High"),]

## Run</pre>
```

CC 7

```
### Inlcudes additional NRW argument: threshold
open <- bootSemNeT(low, high, iter = 100, cores = 2, method = "NRW", type = "case",
methodArgs = list(type = "num", threshold = 3))</pre>
```

CC

Clustering Coefficient

Description

Computes global clustering coefficient CC

Usage

```
CC(A, weighted = FALSE)
```

Arguments

A An adjacency matrix of network data

weighted Is the network weighted? Defaults to FALSE. Set to TRUE for weighted measures

of CC and CCi

Value

Returns the network's CC

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

References

Rubinov, M., & Sporns, O. (2010). Complex network measures of brain connectivity: Uses and interpretations. *NeuroImage*, 52, 1059-1069.

```
# Pearson's correlation only for CRAN checks
A <- TMFG(similarity(sim.fluency(100), method = "cor"))
# Unweighted
cc <- CC(A)</pre>
```

8 CN

CN

Community Network Estimation

Description

Estimates a semantic network using the Community Network method described in Goni et al. (2011)

Usage

```
CN(data, window = 2, alpha = 0.05, enrich = FALSE)
```

Arguments

data	Matrix or data frame. A preprocessed verbal fluency matrix where rows are participants and columns are verbal fluency responses
window	Numeric. Size of window to look for co-occurences in. Defaults to 2
alpha	Numeric. Significance value. Defaults to .05
enrich	Boolean. Should the network be enriched by connecting all nodes in their respective modules? Defaults to FALSE

Value

Returns a undirected semantic network

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

References

Goni, J., Arrondo, G., Sepulcre, J., Martincorena, I., de Mendizabal, N. V., Corominas-Murtra, B., ... & Villoslada, P. (2011). The semantic organization of the animal category: Evidence from semantic verbal fluency and network theory. *Cognitive Processing*, *12*, 183-196.

```
# Get data
data <- open.clean

# Organize group data
## Get group data
group <- open.group

## Low and high openness to experience groups
low <- data[which(group == "Low"),]
high <- data[which(group == "High"),]</pre>
```

compare_nets 9

```
## Not run:
# Compute networks
low.net <- CN(low)
high.net <- CN(high)
## End(Not run)</pre>
```

compare_nets

Plots Networks for Comparison

Description

Uses qgraph to plot networks. Accepts any number of networks and will organize the plots in the number of side-by-side columns using the heuristic of taking the square root of the number of input and rounding down to the nearest integer (i.e., floor(sqrt(length(input)))).

Examples

3 networks: 1 x 3 6 networks: 2 x 3 9 networks: 3 x 3

Usage

```
compare_nets(
    ...,
    title,
    config,
    placement = c("match", "default"),
    weighted = FALSE,
    qgraph.args = list()
)
```

arguments

Arguments

Matrices or data frames of network adjacency matrices title List. Characters denoting titles of plots Character. Defaults to "spring" See qgraph for more options config placement Character. How should nodes be placed when comparing groups? Defaults to "default" • "match" — places nodes in the same position for all networks • "default" — places nodes in the default config positions weighted Boolean. Should networks be plotted with weights? Defaults to FALSE. Set to TRUE to plot networks with weights corresponding to association strength. Often, unweighted networks are more aesthetically representational of the netqgraph.args List. An argument list to be passed onto qgraph. See qgraph for possible 10 convert2cytoscape

Value

Plots networks using ggraph

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

References

Epskamp, S., Cramer, A. O. J., Waldorp, L. J., Schmittmann, V. D., & Borsboom, D. (2012). qgraph: Network visualizations of relationships in psychometric data. *Journal of Statistical Software*, 48, 1-18.

Jones, P. J., Mair, P., & McNally, R. (2018). Visualizing psychological networks: A tutorial in R. *Frontiers in Psychology*, 9, 1742.

Examples

```
# Simulate Datasets
one <- sim.fluency(10)
two <- sim.fluency(10)

# Compute similarity matrix
cos1 <- similarity(one, method = "cosine")
cos2 <- similarity(two, method = "cosine")

# Compute networks
net1 <- TMFG(cos1)
net2 <- TMFG(cos2)

# Compare networks
compare_nets(net1, net2, title = list("One", "Two"), config = "spring")

# Change edge colors
compare_nets(net1, net2, title = list("One", "Two"),
config = "spring", qgraph.args = list(edge.color = "blue"))</pre>
```

convert2cytoscape

Convert Adjacency Matrix to Cytoscape Format

Description

Converts an adjacency matrix to Cytoscape's sparse matrix format

Usage

```
convert2cytoscape(A)
```

convert2igraph 11

Arguments

Α

Matrix or data frame. A cleaned, finalized response matrix ready to be visualized

Value

A sparse matrix formatted for Cytoscape

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

References

Shannon, P., Markiel, A., Ozier, O., Baliga, N. S., Wang, J. T., Ramage, D., ... & Ideker, T. (2003). Cytoscape: A software environment for integrated models of biomolecular interaction networks. *Genome Research*, *13*, 2498-2504.

Examples

```
# Simulate Datasets
one <- sim.fluency(10)
two <- sim.fluency(10)

# Compute similarity matrix
cos1 <- similarity(one, method = "cosine")
cos2 <- similarity(two, method = "cosine")

# Compute networks
net1 <- TMFG(cos1)
net2 <- TMFG(cos2)

# Convert to Cytoscape format
cyto1 <- convert2cytoscape(net1)
cyto2 <- convert2cytoscape(net2)

# Write to .csv
write.csv(cyto1, file.path(tempdir(), "cyto1.csv"), row.names = FALSE)
write.csv(cyto2, file.path(tempdir(), "cyto2.csv"), row.names = FALSE)</pre>
```

convert2igraph

Convert Network(s) to igraph's Format

Description

Converts single or multiple networks into igraph's format for network analysis

Usage

```
convert2igraph(A, neural = FALSE)
```

12 equate

Arguments

A Adjacency matrix (network matrix) or brain connectivity array (from convertConnBrainMat)

neural Defunct.

Value

Returns a network matrix in igraph's format

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

Examples

```
# Pearson's correlation only for CRAN checks
A <- TMFG(similarity(sim.fluency(50), method = "cor"))
igraphNetwork <- convert2igraph(A)</pre>
```

equate

Equate Groups

Description

A function to "equate" multiple response matrices to one another. *N* number of groups are matched based on their responses so that every group has the same responses in their data

Usage

```
equate(...)
```

Arguments

... Matrices, data frames or a list of matrices and data frames. Binary response matrices to be equated

Value

This function returns a list containing the equated binary response matrices in the order they were input. The response matrices are labeled as the object name they were entered with

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

finalize 13

Examples

```
# Obtain binary data
bin <- open.binary

# Finalize mat1
mat1 <- finalize(bin[c(1:5),])

# Finalize mat2
mat2 <- finalize(bin[c(6:10),])

# Equate mat1 and mat1
eq <- equate(mat1, mat2)

# Obtain respective equated response matrices
eq.mat1 <- eq$mat1 # list objects are named with the names
eq.mat2 <- eq$mat2 # they were entered with</pre>
```

finalize

Finalize Response Matrix

Description

Finalizes the response matrix by keeping responses that are given by a certain number of people

Usage

```
finalize(rmat, minCase = 2)
```

Arguments

rmat Binary matrix. A textcleaner filtered response matrix
minCase Numeric. Minimum number of cases to produce a response

Value

A binary response matrix with responses given by at least minCase people

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

```
# Obtain binary data
bin <- open.binary
# Finalize mat1
mat1 <- finalize(bin)</pre>
```

14 net.low

net.high

High Openness to Experience Network

Description

High openness to experience network from Christensen & Kenett (2019)

Usage

```
data(net.high)
```

Format

```
net.high (matrix, 160 x 160)
```

References

Christensen, A. P., & Kenett, Y. N. (2019) Semantic network analysis (SemNA): A tutorial on preprocessing, estimating, and analyzing semantic networks. *PsyArXiv*.

Examples

```
data("net.high")
```

net.low

Low Openness to Experience Network

Description

Low openness to experience network from Christensen & Kenett (2019)

Usage

```
data(net.low)
```

Format

```
net.low (matrix, 160 x 160)
```

References

Christensen, A. P., & Kenett, Y. N. (2019) Semantic network analysis (SemNA): A tutorial on preprocessing, estimating, and analyzing semantic networks. *PsyArXiv*.

```
data("net.low")
```

NRW 15

Naive Random Walk Network Estimation

Description

Estimates a semantic network using the Naive Random Walk method described in Lerner, Ogrocki, and Thomas (2009)

Usage

```
NRW(data, type = c("num", "prop"), threshold = 0)
```

Arguments

data Matrix or data frame. A preprocessed verbal fluency matrix where rows are

participants and columns are verbal fluency responses

type Character. Type of threshold to apply.

• "num" — Minimum number of co-occurrences

• "prop" — Minimum proportion of co-occurrences

Defaults to "num"

threshold Numeric. Value of the minimum number or proportion of co-occurrences. De-

faults to 0 for both "num" and "prop"

Value

Returns a undirected semantic network

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

References

Lerner, A. J., Ogrocki, P. K., & Thomas, P. J. (2009). Network graph analysis of category fluency testing. *Cognitive and Behavioral Neurology*, 22, 45-52.

```
# Get data
data <- open.clean

# Organize group data
## Get group data
group <- open.group

## Low and high openness to experience groups
low <- data[which(group == "Low"),]</pre>
```

open.binary

```
high <- data[which(group == "High"),]
# Compute networks
low.net <- NRW(low)
high.net <- NRW(high)</pre>
```

one.result

Simulated Result for Dataset One

Description

A result of bootSemNeT from a simulated dataset

Usage

```
data(one.result)
```

Format

```
one.result (list, length = 4)
```

Examples

```
data("one.result")
```

open.binary

Binary response Matrices (Openness and Verbal Fluency)

Description

Binary response matrices for the Animals verbal fluency data (n = 516) from Christensen et al. (2018).

Usage

```
data(open.binary)
```

Format

```
open.binary (matrix, 516 x 367)
```

References

Christensen, A. P., Kenett, Y. N., Cotter, K. N., Beaty, R. E., & Silvia, P. J. (2018). Remotely close associations: Openness to experience and semantic memory structure. *European Journal of Personality*, *32*, 480-492.

open.clean 17

Examples

```
data("open.binary")
```

open.clean

Cleaned response Matrices (Openness and Verbal Fluency)

Description

Cleaned response matrices for the Animals verbal fluency data (n = 516) from Christensen et al. (2018).

Usage

```
data(open.clean)
```

Format

```
open.clean (matrix, 516 x 35)
```

References

Christensen, A. P., Kenett, Y. N., Cotter, K. N., Beaty, R. E., & Silvia, P. J. (2018). Remotely close associations: Openness to experience and semantic memory structure. *European Journal of Personality*, *32*, 480-492.

Examples

```
data("open.clean")
```

open.group

Groups for Openness and Verbal Fluency

Description

Groups for the Animals verbal fluency data (n = 516) from Christensen et al. (2018; see also open.clean).

Usage

```
data(open.group)
```

Format

```
open.group (vector, length = 516)
```

18 PF

References

Christensen, A. P., Kenett, Y. N., Cotter, K. N., Beaty, R. E., & Silvia, P. J. (2018). Remotely close associations: Openness to experience and semantic memory structure. *European Journal of Personality*, *32*, 480-492.

Examples

```
data("open.group")
```

PF

Pathfinder Network

Description

Estimates a pathfinder network using the MST-Pathfinder Network method from Quirin et al. (2008; see also Schvaneveldt, 1990)

Usage

PF(data)

Arguments

data

Matrix or data frame. A binary response matrix

Value

An adjacency matrix

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

References

Quirin, A., Cordon, O., Guerrero-Bote, V. P., Vargas-Quesada, B., & Moya-Aneon, F. (2008) A quick MST-based algorithm to obtain Pathfinder networks (Inf, n-1). *Journal of the American Society for Information Science and Technology*, 59, 1912-1924.

Schvaneveldt, R. W. (1990). *Pathfinder associative networks: Studies in knowledge organization*. Norwood, NJ: Ablex Publishing.

```
# Obtain data
data <- open.binary
# Estimate network
pf.net <- PF(data)</pre>
```

plot.animateShiny 19

plot.animateShiny

Animate Networks for Spreading Activation from Shiny

Description

Uses ggraph and ani.record to animate networks. Accepts only one network animation at a time

Usage

```
## S3 method for class 'animateShiny'
plot(x, ...)
```

Arguments

- x Shiny result resultShiny\$spreadingActivationPlot
- ... Additional arguments for ani.record

Value

Plots animated networks using qgraph and ani.record

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

References

Epskamp, S., Cramer, A. O. J., Waldorp, L. J., Schmittmann, V. D., & Borsboom, D. (2012). qgraph: Network visualizations of relationships in psychometric data. *Journal of Statistical Software*, 48, 1-18. Retrieved from: http://www.jstatsoft.org/v48/i04/

```
if(interactive())
{SemNeTShiny()}

## Not run:
   plot(resultShiny$spreadingActivationPlot[[1]])

## End(Not run)
```

20 plot.bootSemNeT

plot.bootSemNeT

Plot for bootSemNeT

Description

Plots output from bootSemNeT

Usage

```
## S3 method for class 'bootSemNeT'
plot(..., groups = NULL, measures = c("ASPL", "CC", "Q"))
```

Arguments

... Object(s) from bootSemNeT

groups Character. Labels for groups in the order they were entered in bootSemNeT

measures Character. Measures to be plotted

Value

Returns plots for the specified measures

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

```
# Simulate Dataset
one <- sim.fluency(20)

# Run partial bootstrap networks
one.result <- bootSemNeT(one, prop = .50, iter = 1000,
sim = "cosine", cores = 2, type = "node", method = "TMFG")

# Plot
plot(one.result, groups = c("One"))</pre>
```

plot.compareShiny 21

plot.compareShiny

Plots Networks for Comparison from Shiny

Description

Uses qgraph to plot networks. Accepts any number of networks and will organize the plots in the number of side-by-side columns using the heuristic of taking the square root of the number of input and rounding down to the nearest integer (i.e., floor(sqrt(length(input)))). Performs the same operations as compare_nets

Examples

3 networks: 1 x 3 6 networks: 2 x 3 9 networks: 3 x 3

Usage

```
## S3 method for class 'compareShiny' plot(x, ...)
```

Arguments

- x Shiny result resultShiny\$comparePlot
- . . . Additional arguments

Value

Plots networks using qgraph

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

References

Epskamp, S., Cramer, A. O. J., Waldorp, L. J., Schmittmann, V. D., & Borsboom, D. (2012). qgraph: Network visualizations of relationships in psychometric data. *Journal of Statistical Software*, 48, 1-18.

Q

Examples

```
# Simulate Datasets
one <- sim.fluency(10)
two <- sim.fluency(10)

# Compute similarity matrix
cos1 <- similarity(one, method = "cosine")
cos2 <- similarity(two, method = "cosine")

# Compute networks
net1 <- TMFG(cos1)
net2 <- TMFG(cos2)

# Compare networks
compare_nets(net1, net2, title = list("One", "Two"), config = "spring")

# Change edge colors
compare_nets(net1, net2, title = list("One", "Two"),
config = "spring", qgraph.args = list(edge.color = "blue"))</pre>
```

Q

Modularity

Description

Computes a global modularity measure (Q) using the Louvain community detection algorithm

Usage

Q(A)

Arguments

Α

An adjacency matrix of network data

Value

Returns Q or a measure of how well the communities in the network are compartmentalized

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

References

Blondel, V. D., Guillaume, J. L., Lambiotte, R., & Lefebvre, E. (2008). Fast unfolding of communities in large networks. *Journal of Statistical Mechanics: Theory and Experiment*, 2008, P10008. Rubinov, M., & Sporns, O. (2010). Complex network measures of brain connectivity: Uses and interpretations. *NeuroImage*, 52, 1059-1069.

randnet.test 23

Examples

```
# Pearson's correlation only for CRAN checks
A <- TMFG(similarity(sim.fluency(100), method = "cor"))
modularity <- Q(A)</pre>
```

randnet.test

Test Against Random Networks

Description

Performs significance tests for global measures of semantic networks against the global measures of equivalent size (and density) random networks

Usage

```
randnet.test(..., iter, cores)
```

Arguments

... Matrices or data frames. Semantic networks to be compared against random

networks

iter Numeric. Number of iterations in bootstrap. Defaults to 1000

cores Number of computer processing cores to use for bootstrapping samples. De-

faults to n-1 total number of cores. Set to any number between 1 and maximum

amount of cores on your computer

Value

Returns a matrix containing p-values for the network measures of the input networks against the distribution of equivalent random networks. The last two columns contain the mean ("M.rand") and standard deviation ("SD.rand") of the network measures for the random network distribution

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

24 randwalk

Examples

```
# Get openness data
one <- open.clean[which(open.group == "Low"),]
two <- open.clean[which(open.group == "High"),]

# Compute networks
net.one <- CN(one)
net.two <- CN(two)

# Perform random networks test
randnet.test(net.one, net.two, iter = 100, cores = 2)</pre>
```

randwalk

Random Walk Simulation

Description

Simulates random walks over two networks to examine the characteristics of spontaneous spreading activation (see Kenett & Austerweil, 2016)

Usage

```
randwalk(A, B, reps = 20, steps = 10, iter = 10000, cores)
```

Arguments

A	Matrix or data frame. Adjacency matrix of a semantic network
В	Matrix or data frame. A comparison adjacency matrix of a semantic network
reps	Numeric. Number of repetitions of increments in 10 steps. Defaults to 20
steps	Numeric. Number of random steps to begin with. Defaults to 10
iter	Numeric. Number of iterations for each random walk. Defaults to 10000
cores	Numeric. Number of computer processing cores to use for bootstrapping samples. Defaults to $n - 1$ total number of cores. Set to any number between 1 and maximum amount of cores on your computer

Value

A result matrix containing the means and standard deviations for several measures as well as p-values for a Mann-Whitney U test

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com> and Yoed Kenett <yoedkenett@gmail.com>

response.analysis 25

References

Kenett, Y. N., & Austerweil, J. L. (2016). Examining search processes in low and high creative individuals with random walks. In *Paper presented at the proceedings of the 38th annual meeting of the cognitive science society*. Austin, TX.

Examples

```
# Simulate Datasets
one <- sim.fluency(10)
two <- sim.fluency(10)

# Compute similarity matrix
cos1 <- similarity(one, method = "cosine")
cos2 <- similarity(two, method = "cosine")

# Compute networks
net1 <- TMFG(cos1)
net2 <- TMFG(cos2)

# Run random walk analysis
rw.results <- randwalk(net1, net2, iter = 100, cores = 2)</pre>
```

response.analysis

Response Analysis

Description

Computes the difference in the total and unique number of responses between two groups (follows Christensen et al., 2018)

Usage

```
response.analysis(...)
```

Arguments

. . . Matrix or data frame. Responses matrices for two different groups

Value

A list containing objects:

total

A vector with the total responses given by each participant. A *t*-test is used to compare, on average, whether one group provides more response than the other

26 semnetmeas

unique

A vector with the number of unique responses provided by both groups (Total Across Groups), the number of unique responses provided by each group (Total), and the number of unique responses provided by each group that were *not* provided by the other group (Unique). A McNemar's test is used to compare whether the number of unique responses are different between groups

Examples

```
# Obtain data
low <- open.clean[which(open.group == "Low"),]
high <- open.clean[which(open.group == "High"),]
# Perform analysis
response.analysis(low, high)</pre>
```

semnetmeas

Semantic Network Measures

Description

Computes the average shortest path length (ASPL), clustering coefficient(CC), and modularity (Q) of the network

Usage

```
semnetmeas(A, meas = c("ASPL", "CC", "Q"), weighted = FALSE)
```

Arguments

A Matrix or data frame. An adjacency matrix of a network

meas Character. Global network measures to compute. By default, computes ASPL,

CC, and Q. Individual measures can be selected

weighted Boolean. Should weighted measures be computed? Defaults to FALSE. Set to

TRUE for weighted measures

Value

Returns a values for ASPL, CC, and Q

SemNeTShiny 27

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

Examples

```
# Simulate Datasets
one <- sim.fluency(10)

# Compute similarity matrix
cos <- similarity(one, method = "cosine")

# Compute networks
net <- TMFG(cos)

# Compute global network measures
globmeas <- semnetmeas(net)</pre>
```

SemNeTShiny

Shiny App for SemNeT

Description

An interactive Shiny application for running SemNeT analysis.

Usage

```
SemNeTShiny()
```

Value

A list called resultShiny containing:

data The data imported into SemNeTShiny

group The grouping variable imported into SemNeTShiny

network The networks generated during SemNeTShiny session. The networks are labelled

using the provided grouping variable

measures Network measures ASPL (Average Shortest Path Lengths), CC (Clustering Co-

efficient), and Q (Modularity) for the networks generated during SemNeTShiny

(see semnetmeas)

comparePlot A visualization of the networks generated during SemNeTShiny

(see compare_nets)

randomTest Statistical results from the Random Network Test in SemNeTShiny (see randnet.test)

bootstrap Results from the Bootstrap Network Analysis in SemNeTShiny (see bootSemNeT)

28 sim.fluency

bootstrapTest Statistical results from the Bootstrap Network Analysis (see test.bootSemNeT)

bootstrapPlot Plots of the statistical results from the Bootstrap Network Analysis (see plot.bootSemNeT)

randomWalk Results from the Random Walk Analysis (see randwalk)

bootstrapPlot Results from the Spreading Activation Analysis (see spreadr)

Examples

```
if(interactive())
{SemNeTShiny()}
```

sim.fluency

Simulates a verbal fluency binary response matrix

Description

Simulates verbal fluency data based on the number of nodes in the desired network. The summed total of each response is simulated from a poisson distribution (see rpois), using frequencies from the animals.freq data. Using these sums, participants responses are simulated with a probability of giving a response as the total of the summed response over the number of participants.

Usage

```
sim.fluency(nodes, cases, random = FALSE)
```

Arguments

nodes Numeric. Number of nodes to simulate in data. Defaults to 100

cases Numeric. Number of participants to simulate in data. Defaults to 500

random Boolean. Should the frequencies be randomly sampled from? Defaults to FALSE.

Value

A binary matrix with p (participants) by n (nodes)

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

```
# Simulate data for 50 nodes and 200 participants
sim.fluency(nodes = 50, cases = 200)
```

similarity 29

similarity

Measures of Similarity

Description

Computes several measures of similarity (see Choi, Cha, & Tappert, 2010 for additional measures)

Usage

```
similarity(
  data,
  method = c("angular", "cor", "cosine", "euclid", "faith", "jaccard", "phi", "rr")
)
```

Arguments

data method Matrix or data frame. A binarized dataset of verbal fluency or linguistic data Character. Type of similarity measure to compute.

Below are the definitions for each bin:

Options include:

- "angular" = $1 (2 * acos(cosinesimilarity)/\pi)$
- "cosine" = $a/\sqrt{(a+b)(a+c)}$
- "faith" = a + 0.5d/a + b + c + d
- "jaccard" = a/a + b + c
- "phi" and "cor" = $ad bc/\sqrt{(R1xR2xC1xC2)}$
- "rr" = a/a + b + c + d

Value

A symmetric similarity matrix

Author(s)

Alexander Christensen <alexpaulchristensen@gmail.com>

30 test.bootSemNeT

Examples

```
# Simulate Datasets
one <- sim.fluency(10)
# Compute similarity matrix
cos <- similarity(one, method = "cosine")</pre>
```

test.bootSemNeT

Statistical tests for bootSemNeT

Description

Computes statistical tests for bootstrapped networks from bootSemNeT

Usage

```
test.bootSemNeT(
  test = c("ANCOVA", "ANOVA", "t-test"),
 measures = c("ASPL", "CC", "Q"),
 formula = NULL,
  groups = NULL
)
```

Arguments

Object(s) from bootSemNeT

test Character. Type of statistical test to be used.

- "t-test" Computes t-tests for all measures
- "ANOVA" Computes ANOVAs and includes Tukey's HSD for pairwise comparisons (TukeyHSD)
- "ANCOVA" Computes ANCOVAs that control for the number of nodes and edges in the networks and includes adjusted means and Tukey's HSD for pairwise comparisons (TukeyHSD)

Character. Network measures to be tested. measures

- ASPL Average shortest path length
- CC Clustering coefficient
- Q Modularity statistic

formula Character. A formula for specifying an ANOVA structure. The formula should

> have the predictor variable as "y" and include the names the variables are grouped by (e.g., formula = "y ~ group_var1 * group_var2"). See Two-way ANOVA

example in examples

Data frame. A data frame specifying the groups to be input into the formula. groups The column names should be the variable names of interest. The groups should

be in the same order as the groups input into bootSemNeT

test.bootSemNeT 31

Value

Returns a list containing the objects:

ASPL Test statistics for each proportion of nodes remaining for ASPL
CC Test statistics for each proportion of nodes remaining for CC
Q Test statistics for each proportion of nodes remaining for Q

If two groups:

A matrix in each object has the following columns:

t-statistic Statistic from the t.test
df Degrees of freedom

p-value p-value with values equal to 0 being p < .001

d Cohen's d

CI95.lower Lower bound of the 95 percent confidence interval Upper bound of the 95 percent confidence interval

Direction Direction of the effect. The argument groups will specify specifically which

group is higher or lower on the measure. If no groups are input, then "d" and "p" are used to represent data and paired samples from bootSemNeT, respectively

Row names refer to the proportion of nodes remaining in bootstrapped networks

If three or more groups:

A list containing two objects:

ANOVA A matrix containing the *F*-statistic, group degrees of freedom, residual degrees

of freedom, p-value, and partial eta squared p.eta.sq

HSD A matrix containing the differences between each group (diff), lower (lwr) and

upper (upr) bounds of the 95% confidence interval, and the adjusted p-value

(p.adj)

```

TMFG

Triangulated Maximally Filtered Graph

Description

Applies the Triangulated Maximally Filtered Graph (TMFG) filtering method (**Please see and cite Massara et al., 2016**). The TMFG method uses a structural constraint that limits the number of zero-order correlations included in the network (3n - 6; where *n* is the number of variables). The TMFG algorithm begins by identifying four variables which have the largest sum of correlations to all other variables. Then, it iteratively adds each variable with the largest sum of three correlations to nodes already in the network until all variables have been added to the network. This structure can be associated with the inverse correlation matrix (i.e., precision matrix) to be turned into a GGM (i.e., partial correlation network) by using LoGo. See Details for more information on this network estimation method.

Usage

```
TMFG(data, depend = FALSE)
```

TMFG 33

Arguments

data Matrix or data frame. Must be a square matrix

depend Boolean. Is network a dependency (or directed) network? Defaults to FALSE.

Set to TRUE to generate a TMFG-filtered dependency network (output obtained

from the depend function)

Details

The TMFG method applies a structural constraint on the network, which restrains the network to retain a certain number of edges (3*n*-6, where *n* is the number of nodes; Massara et al., 2016). The network is also composed of 3- and 4-node cliques (i.e., sets of connected nodes; a triangle and tetrahedron, respectively). The TMFG method constructs a network using zero-order correlations and the resulting network can be associated with the inverse covariance matrix (yielding a GGM; Barfuss, Massara, Di Matteo, & Aste, 2016). Notably, the TMFG can use any association measure and thus does not assume the data is multivariate normal.

Construction begins by forming a tetrahedron of the four nodes that have the highest sum of correlations that are greater than the average correlation in the correlation matrix. Next, the algorithm iteratively identifies the node that maximizes its sum of correlations to a connected set of three nodes (triangles) already included in the network and then adds that node to the network. The process is completed once every node is connected in the network. In this process, the network automatically generates what's called a planar network. A planar network is a network that could be drawn on a sphere with no edges crossing (often, however, the networks are depicted with edges crossing; Tumminello, Aste, Di Matteo, & Mantegna, 2005).

Value

Returns an TMFG filtered adjacency matrix
