

# Package ‘midasr’

July 22, 2025

**Title** Mixed Data Sampling Regression

**Description** Methods and tools for mixed frequency time series data analysis.  
Allows estimation, model selection and forecasting for MIDAS regressions.

**URL** <http://mpiktas.github.io/midasr/>

**Version** 0.9

**Depends** R (>= 2.11.0), sandwich, optimx, quantreg

**Imports** MASS, numDeriv, Matrix, forecast, zoo, stats, graphics, utils,  
Formula, texreg, methods

**License** GPL-2 | MIT + file LICENCE

**BugReports** <https://github.com/mpiktas/midasr/issues>

**Suggests** testthat, lubridate, xts

**RoxygenNote** 7.3.2

**Encoding** UTF-8

**Collate** 'deriv.R' 'imidasreg.R' 'lagspec.R' 'midas\_nlpr.R'  
'midas\_r\_methods.R' 'midas\_nlpr\_methods.R' 'midas\_qr\_methods.R'  
'midas\_sp.R' 'midas\_sp\_methods.R' 'midaslag.R' 'midasqr.R'  
'midasr-package.R' 'midasreg.R' 'modsel.R' 'nonparametric.R'  
'simulate.R' 'tests.R'

**NeedsCompilation** no

**Author** Vaidotas Zemlys-Balevičius [cre],  
Virmantas Kvedaras [aut],  
Vaidotas Zemlys-Balevičius [aut]

**Maintainer** Vaidotas Zemlys-Balevičius <zemlys@gmail.com>

**Repository** CRAN

**Date/Publication** 2025-04-07 10:50:02 UTC

+.lws_table	<i>Combine lws_table objects</i>
-------------	----------------------------------

---

**Description**

Combines lws\_table objects

**Usage**

```
## S3 method for class 'lws_table'
... + check = TRUE
```

**Arguments**

...	lws_table object
check	logical, if TRUE checks that the each lws_table object is named a list with names c("weights", "lags", "starts")

**Details**

The lws\_table objects have similar structure to table, i.e. it is a list with 3 elements which are the lists with the same number of elements. The base function c would cbind such tables. This function rbinds them.

**Value**

lws\_table object

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

**Examples**

```
n1mn <- expand_weights_lags("nealmon", 0, c(4, 8), 1, start=list(nealmon=rep(0, 3)))
nbt <- expand_weights_lags("nbeta", 0, c(4, 8), 1, start=list(nbeta=rep(0, 4)))

n1mn+nbt
```

---

`agk.test`*Andreou, Ghysels, Kourtellos LM test*

---

**Description**

Perform the test whether hyperparameters of normalized exponential Almon lag weights are zero

**Usage**

```
agk.test(x)
```

**Arguments**

`x` MIDAS regression object of class `midas_r`

**Value**

a `htest` object

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

**References**

Andreou E., Ghysels E., Kourtellos A. *Regression models with mixed sampling frequencies* Journal of Econometrics 158 (2010) 246-261

**Examples**

```
##' ##Load data
data("USunempr")
data("USrealgdp")

y <- diff(log(USrealgdp))
x <- window(diff(USunempr), start=1949)
t <- 1:length(y)

mr <- midas_r(y~t+fmls(x, 11, 12, nealmon), start=list(x=c(0, 0, 0)))

agk.test(mr)
```

---

almonp	<i>Almon polynomial MIDAS weights specification</i>
--------	---

---

**Description**

Calculate Almon polynomial MIDAS weights

**Usage**

almonp(p, d, m)

**Arguments**

p	parameters for Almon polynomial weights
d	number of coefficients
m	the frequency ratio, currently ignored

**Value**

vector of coefficients

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

---

almonp_gradient	<i>Gradient function for Almon polynomial MIDAS weights</i>
-----------------	---

---

**Description**

Calculate gradient for Almon polynomial MIDAS weights specification

**Usage**

almonp\_gradient(p, d, m)

**Arguments**

p	vector of parameters for Almon polynomial specification
d	number of coefficients
m	the frequency ratio, currently ignored

**Value**

vector of coefficients

**Author(s)**

Vaidotas Zemlys

---

amidas_table	<i>Weight and lag selection table for aggregates based MIDAS regression model</i>
--------------	---

---

**Description**

Create weight and lag selection table for the aggregates based MIDAS regression model

**Usage**

```
amidas_table(
  formula,
  data,
  weights,
  wstart,
  type,
  start = NULL,
  from,
  to,
  IC = c("AIC", "BIC"),
  test = c("hAh_test"),
  Ofunction = "optim",
  weight_gradients = NULL,
  ...
)
```

**Arguments**

- formula      the formula for MIDAS regression, the lag selection is performed for the last MIDAS lag term in the formula
- data          a list containing data with mixed frequencies
- weights      the names of weights used in Ghysels schema
- wstart      the starting values for the weights of the first low frequency lag
- type          the type of Ghysels schema see [amweights](#), can be a vector of types
- start        the starting values for optimisation excluding the starting values for the last term
- from         a named list, or named vector with high frequency (NB!) lag numbers which are the beginnings of MIDAS lag structures. The names should correspond to the MIDAS lag terms in the formula for which to do the lag selection. Value NA indicates lag start at zero
- to            to a named list where each element is a vector with two elements. The first element is the low frequency lag number from which the lag selection starts, the second is the low frequency lag number at which the lag selection ends. NA indicates lowest (highest) lag numbers possible.

IC	the names of information criteria which should be calculated
test	the names of statistical tests to perform on restricted model, p-values are reported in the columns of model selection table
Ofunction	see <a href="#">midasr</a>
weight_gradients	see <a href="#">midas_r</a>
...	additional parameters to optimisation function, see <a href="#">midas_r</a>

### Details

This function estimates models sequentially increasing the midas lag from `kmin` to `kmax` and varying the weights of the last term of the given formula

This function estimates models sequentially increasing the midas lag from `kmin` to `kmax` and varying the weights of the last term of the given formula

### Value

a `midas_r_ic_table` object which is the list with the following elements:

table	the table where each row contains calculated information criteria for both restricted and unrestricted MIDAS regression model with given lag structure
candlist	the list containing fitted models
IC	the argument IC
test	the argument test
weights	the names of weight functions
lags	the lags used in models

### Author(s)

Virmantas Kvedaras, Vaidotas Zemlys

### Examples

```
data("USunempr")
data("USrealgdp")
y <- diff(log(USrealgdp))
x <- window(diff(USunempr), start=1949)
trend <- 1:length(y)

tb <- amidas_table(y~trend+fmIs(x,12,12,nealmon),
                  data=list(y=y,x=x,trend=trend),
                  weights=c("nealmon"),wstart=list(nealmon=c(0,0,0)),
                  start=list(trend=1),type=c("A"),
                  from=0,to=c(1,2))
```

amweights

*Weights for aggregates based MIDAS regressions***Description**

Produces weights for aggregates based MIDAS regression

**Usage**

```
amweights(p, d, m, weight = nealmon, type = c("A", "B", "C"))
```

**Arguments**

p	parameters for weight functions, see details.
d	number of high frequency lags
m	the frequency
weight	the weight function
type	type of structure, a string, one of A, B or C.

**Details**

Suppose a weight function  $w(\beta, \theta)$  satisfies the following equation:

$$w(\beta, \theta) = \beta g(\theta)$$

The following combinations are defined, corresponding to structure types A, B and C respectively:

$$(w(\beta_1, \theta_1), \dots, w(\beta_k, \theta_k))$$

$$(w(\beta_1, \theta), \dots, w(\beta_k, \theta))$$

$$\beta(w(1, \theta), \dots, w(1, \theta)),$$

where  $k$  is the number of low frequency lags, i.e.  $d/m$ . If the latter value is not whole number, the error is produced.

The starting values  $p$  should be supplied then as follows:

$$(\beta_1, \theta_1, \dots, \beta_k, \theta_k)$$

$$(\beta_1, \dots, \beta_k, \theta)$$

$$(\beta, \theta)$$

**Value**

a vector of weights

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

---

average\_forecast      *Average forecasts of MIDAS models*

---

### Description

Average MIDAS model forecasts using specified weighting scheme. Produce in-sample and out-of-sample accuracy measures.

### Usage

```
average_forecast(
  modlist,
  data,
  insample,
  outsample,
  type = c("fixed", "recursive", "rolling"),
  fweights = c("EW", "BICW", "MSFE", "DMSFE"),
  measures = c("MSE", "MAPE", "MASE"),
  show_progress = TRUE
)
```

### Arguments

modlist	a list of midas_r objects
data	a list with mixed frequency data
insample	the low frequency indexes for in-sample data
outsample	the low frequency indexes for out-of-sample data
type	a string indicating which type of forecast to use.
fweights	names of weighting schemes
measures	names of accuracy measures
show_progress	logical, TRUE to show progress bar, FALSE for silent evaluation

### Details

Given the data, split it to in-sample and out-of-sample data. Then given the list of models, reestimate each model with in-sample data and produce out-of-sample forecast. Given the forecasts average them with the specified weighting scheme. Then calculate the accuracy measures for individual and average forecasts.

The forecasts can be produced in 3 ways. The "fixed" forecast uses model estimated with in-sample data. The "rolling" forecast reestimates model each time by increasing the in-sample by one low frequency observation and dropping the first low frequency observation. These reestimated models then are used to produce out-of-sample forecasts. The "recursive" forecast differs from "rolling" that it does not drop observations from the beginning of data.

**Value**

a list containing forecasts and tables of accuracy measures

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

**Examples**

```

set.seed(1001)
## Number of low-frequency observations
n<-250
## Linear trend and higher-frequency explanatory variables (e.g. quarterly and monthly)
trend<-c(1:n)
x<-rnorm(4*n)
z<-rnorm(12*n)
## Exponential Almon polynomial constraint-consistent coefficients
fn.x <- nealmon(p=c(1,-0.5),d=8)
fn.z <- nealmon(p=c(2,0.5,-0.1),d=17)
## Simulated low-frequency series (e.g. yearly)
y<-2+0.1*trend+m1s(x,0:7,4)%*%fn.x+m1s(z,0:16,12)%*%fn.z+rnorm(n)
mod1 <- midas_r(y ~ trend + m1s(x, 4:14, 4, nealmon) + m1s(z, 12:22, 12, nealmon),
               start=list(x=c(10,1,-0.1),z=c(2,-0.1)))
mod2 <- midas_r(y ~ trend + m1s(x, 4:20, 4, nealmon) + m1s(z, 12:25, 12, nealmon),
               start=list(x=c(10,1,-0.1),z=c(2,-0.1)))

##Calculate average forecasts
avgf <- average_forecast(list(mod1,mod2),
                          data=list(y=y,x=x,z=z,trend=trend),
                          insample=1:200,outsample=201:250,
                          type="fixed",
                          measures=c("MSE","MAPE","MASE"),
                          fweights=c("EW","BICW","MSFE","DMSFE"))

```

---

check\_mixfreq

*Check data for MIDAS regression*

---

**Description**

Given mixed frequency data check whether higher frequency data can be converted to the lowest frequency.

**Usage**

```
check_mixfreq(data)
```

**Arguments**

data            a list containing mixed frequency data

**Details**

The number of observations in higher frequency data elements should have a common divisor with the number of observations in response variable. It is always assumed that the response variable is of the lowest frequency.

**Value**

a boolean TRUE, if mixed frequency data is conformable, FALSE if it is not.

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

---

coef.midas_nlpr	<i>Extract coefficients of MIDAS regression</i>
-----------------	---

---

**Description**

Extracts various coefficients of MIDAS regression

**Usage**

```
## S3 method for class 'midas_nlpr'
coef(object, type = c("plain", "midas", "nlpr"), term_names = NULL, ...)
```

**Arguments**

object	midas_nlpr object
type	one of plain, midas, or nlpr. Returns appropriate coefficients.
term_names	a character vector with term names. Default is NULL, which means that coefficients of all the terms are returned
...	not used currently

**Details**

MIDAS regression has two sets of coefficients. The first set is the coefficients associated with the parameters of weight functions associated with MIDAS regression terms. These are the coefficients of the NLS problem associated with MIDAS regression. The second is the coefficients of the linear model, i.e the values of weight functions of terms, or so called MIDAS coefficients. By default the function returns the first set of the coefficients.

**Value**

a vector with coefficients

**Author(s)**

Vaidotas Zemlys

---

coef.midas_r	<i>Extract coefficients of MIDAS regression</i>
--------------	---

---

**Description**

Extracts various coefficients of MIDAS regression

**Usage**

```
## S3 method for class 'midas_r'
coef(object, midas = FALSE, term_names = NULL, ...)
```

**Arguments**

object	midas_r object
midas	logical, if TRUE, MIDAS coefficients are returned, if FALSE (default), coefficients of NLS problem are returned
term_names	a character vector with term names. Default is NULL, which means that coefficients of all the terms are returned
...	not used currently

**Details**

MIDAS regression has two sets of coefficients. The first set is the coefficients associated with the parameters of weight functions associated with MIDAS regression terms. These are the coefficients of the NLS problem associated with MIDAS regression. The second is the coefficients of the linear model, i.e the values of weight functions of terms, or so called MIDAS coefficients. By default the function returns the first set of the coefficients.

**Value**

a vector with coefficients

**Author(s)**

Vaidotas Zemlys

**Examples**

```
#Simulate MIDAS regression
n<-250
trend<-c(1:n)
x<-rnorm(4*n)
z<-rnorm(12*n)
fn.x <- nealmon(p=c(1,-0.5),d=8)
fn.z <- nealmon(p=c(2,0.5,-0.1),d=17)
y<-2+0.1*trend+m1s(x,0:7,4)%*%fn.x+m1s(z,0:16,12)%*%fn.z+rnorm(n)
eqr<-midas_r(y ~ trend + m1s(x, 0:7, 4, nealmon) +
```

```

mls(z, 0:16, 12, nealmon),
start = list(x = c(1, -0.5), z = c(2, 0.5, -0.1)))

coef(eqr)
coef(eqr, term_names = "x")
coef(eqr, midas = TRUE)
coef(eqr, midas = TRUE, term_names = "x")

```

---

coef.midas_sp	<i>Extract coefficients of MIDAS regression</i>
---------------	---

---

### Description

Extracts various coefficients of MIDAS regression

### Usage

```

## S3 method for class 'midas_sp'
coef(object, type = c("plain", "midas", "bw"), term_names = NULL, ...)

```

### Arguments

object	midas_nlpr object
type	one of plain, midas, or nlpr. Returns appropriate coefficients.
term_names	a character vector with term names. Default is NULL, which means that coefficients of all the terms are returned
...	not used currently

### Details

MIDAS regression has two sets of coefficients. The first set is the coefficients associated with the parameters of weight functions associated with MIDAS regression terms. These are the coefficients of the NLS problem associated with MIDAS regression. The second is the coefficients of the linear model, i.e the values of weight functions of terms, or so called MIDAS coefficients. By default the function returns the first set of the coefficients.

### Value

a vector with coefficients

### Author(s)

Vaidotas Zemlys

---

deriv_tests	<i>Check whether non-linear least squares restricted MIDAS regression problem has converged</i>
-------------	---

---

**Description**

Computes the gradient and hessian of the optimisation function of restricted MIDAS regression and checks whether the conditions of local optimum are met. Numerical estimates are used.

**Usage**

```
deriv_tests(x, tol = 1e-06)

## S3 method for class 'midas_r'
deriv_tests(x, tol = 1e-06)
```

**Arguments**

x	midas_r object
tol	a tolerance, values below the tolerance are considered zero

**Value**

a list with gradient, hessian of optimisation function and convergence message

**Author(s)**

Vaidotas Zemlys

**See Also**

midas\_r

---

deviance.midas_nlpr	<i>Non-linear parametric MIDAS regression model deviance</i>
---------------------	--

---

**Description**

Returns the deviance of a fitted MIDAS regression object

**Usage**

```
## S3 method for class 'midas_nlpr'
deviance(object, ...)
```

**Arguments**

object            a `midas_r` object  
...                currently nothing

**Value**

The sum of squared residuals

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

---

`deviance.midas_r`            *MIDAS regression model deviance*

---

**Description**

Returns the deviance of a fitted MIDAS regression object

**Usage**

```
## S3 method for class 'midas_r'  
deviance(object, ...)
```

**Arguments**

object            a `midas_r` object  
...                currently nothing

**Value**

The sum of squared residuals

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

---

deviance.midas_sp	<i>Semi-parametric MIDAS regression model deviance</i>
-------------------	--

---

**Description**

Returns the deviance of a fitted MIDAS regression object

**Usage**

```
## S3 method for class 'midas_sp'  
deviance(object, ...)
```

**Arguments**

object	a <code>midas_r</code> object
...	currently nothing

**Value**

The sum of squared residuals

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

---

dmls	<i>MIDAS lag structure for unit root processes</i>
------	--

---

**Description**

Prepares MIDAS lag structure for unit root processes

**Usage**

```
dmls(x, k, m, ...)
```

**Arguments**

x	a vector
k	maximal lag order
m	frequency ratio
...	further arguments used in fitting MIDAS regression

**Value**

a matrix containing the first differences and the lag k+1.

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

---

expand_amidas	<i>Create table of weights, lags and starting values for Ghysels weight schema</i>
---------------	--

---

**Description**

Create table of weights, lags and starting values for Ghysels weight schema, see [amweights](#)

**Usage**

```
expand_amidas(weight, type = c("A", "B", "C"), from = 0, to, m, start)
```

**Arguments**

weight	the names of weight functions
type	the type of Ghysels schema, "A", "B" or "C"
from	the high frequency lags from which to start the fitting
to	to a vector of length two, containing minimum and maximum lags, high frequency if m=1, low frequency otherwise.
m	the frequency ratio
start	the starting values for the weights of the one low frequency lag

**Details**

Given weight function creates lags starting from kmin to kmax and replicates starting values for each low frequency lag.

**Value**

a lws\_table object, a list with elements weights, lags and starts

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

**Examples**

```
expand_amidas("nealmon", "A", 0, c(1, 2), 12, c(0, 0, 0))
```

---

expand\_weights\_lags     *Create table of weights, lags and starting values*

---

## Description

Creates table of weights, lags and starting values

## Usage

```
expand_weights_lags(weights, from = 0, to, m = 1, start)
```

## Arguments

weights	either a vector with names of the weight functions or a named list of weight functions
from	the high frequency lags from which to start the fitting
to	a vector of length two, containing minimum and maximum lags, high frequency if m=1, low frequency otherwise.
m	the frequency ratio
start	a named list with the starting values for weight functions

## Details

For each weight function creates lags starting from kmin to kmax. This is a convenience function for easier work with the function [midas\\_r\\_ic\\_table](#).

## Value

a lws\_table object, a list with elements weights, lags and starts.

## Author(s)

Virmantas Kvedaras, Vaidotas Zemlys

## Examples

```
expand_weights_lags(c("nealmon", "nbeta"), 0, c(4, 8), 1, start=list(nealmon=rep(0, 3), nbeta=rep(0, 4)))
nlmn <- expand_weights_lags("nealmon", 0, c(4, 8), 1, start=list(nealmon=rep(0, 3)))
nbt <- expand_weights_lags("nbeta", 0, c(4, 8), 1, start=list(nbeta=rep(0, 4)))

nlmn+nbt
```

---

extract.midas_r	<i>Extract coefficients and GOF measures from MIDAS regression object</i>
-----------------	---

---

**Description**

Extract coefficients and GOF measures from MIDAS regression object

**Usage**

```
extract.midas_r(
  model,
  include.rsquared = TRUE,
  include.nobs = TRUE,
  include.rmse = TRUE,
  ...
)
```

**Arguments**

model	a MIDAS regression object
include.rsquared	If available: should R-squared be reported?
include.nobs	If available: should the number of observations be reported?
include.rmse	If available: should the root-mean-square error (= residual standard deviation) be reported?
...	additional parameters passed to summary

**Value**

texreg object

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

---

fitted.midas_nlpr	<i>Fitted values for non-linear parametric MIDAS regression model</i>
-------------------	---

---

**Description**

Returns the fitted values of a fitted non-linear parametric MIDAS regression object

**Usage**

```
## S3 method for class 'midas_nlpr'
fitted(object, ...)
```

**Arguments**

object            a *midas\_r* object  
...                currently nothing

**Value**

the vector of fitted values

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

---

*fitted.midas\_sp*            *Fitted values for semi-parametric MIDAS regression model*

---

**Description**

Returns the fitted values of a fitted semi-parametric MIDAS regression object

**Usage**

```
## S3 method for class 'midas_sp'  
fitted(object, ...)
```

**Arguments**

object            a *midas\_r* object  
...                currently nothing

**Value**

the vector of fitted values

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

---

fmls	<i>Full MIDAS lag structure</i>
------	---------------------------------

---

**Description**

Create a matrix of MIDAS lags, including contemporaneous lag up to selected order.

**Usage**

```
fmls(x, k, m, ...)
```

**Arguments**

x	a vector
k	maximum lag order
m	frequency ratio
...	further arguments

**Details**

This is a convenience function, it calls `link{mls}` to perform actual calculations.

**Value**

a matrix containing the lags

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

**See Also**

mls

---

forecast.midas_r	<i>Forecast MIDAS regression</i>
------------------	----------------------------------

---

**Description**

Forecasts MIDAS regression given the future values of regressors. For dynamic models (with lagged response variable) there is an option to calculate dynamic forecast, when forecasted values of response variable are substituted into the lags of response variable.

**Usage**

```
## S3 method for class 'midas_r'
forecast(
  object,
  newdata = NULL,
  se = FALSE,
  level = c(80, 95),
  fan = FALSE,
  npaths = 999,
  method = c("static", "dynamic"),
  insample = get_estimation_sample(object),
  show_progress = TRUE,
  add_ts_info = FALSE,
  ...
)
```

**Arguments**

object	midas_r object
newdata	a named list containing future values of mixed frequency regressors. The default is NULL, meaning that only in-sample data is used.
se	logical, if TRUE, the prediction intervals are calculated
level	confidence level for prediction intervals
fan	if TRUE, level is set to seq(50,99,by=1). This is suitable for fan plots
npaths	the number of samples for simulating prediction intervals
method	the forecasting method, either "static" or "dynamic"
insample	a list containing the historic mixed frequency data
show_progress	logical, if TRUE, the progress bar is shown if se = TRUE
add_ts_info	logical, if TRUE, the forecast is cast as ts object. Some attempts are made to guess the correct start, by assuming that the response variable is a ts object of frequency 1. If FALSE, then the result is simply a numeric vector.
...	additional arguments to simulate.midas_r

**Details**

Given future values of regressors this function combines the historical values used in the fitting the MIDAS regression model and calculates the forecasts.

**Value**

an object of class "forecast", a list containing following elements:

method	the name of forecasting method: MIDAS regression, static or dynamic
model	original object of class midas_r
mean	point forecasts

lower	lower limits for prediction intervals
upper	upper limits for prediction intervals
fitted	fitted values, one-step forecasts
residuals	residuals from the fitted model
x	the original response variable

The methods `print`, `summary` and `plot` from package `forecast` can be used on the object.

### Author(s)

Vaidotas Zemlys

### Examples

```

data("USrealgdp")
data("USunempr")

y <- diff(log(USrealgdp))
x <- window(diff(USunempr), start = 1949)
trend <- 1:length(y)

##24 high frequency lags of x included
mr <- midas_r(y ~ trend + fmls(x, 23, 12, nealmon), start = list(x = rep(0, 3)))

##Forecast horizon
h <- 3
##Declining unemployment
xn <- rep(-0.1, 12*h)
##New trend values
trendn <- length(y) + 1:h

##Static forecasts combining historic and new high frequency data
forecast(mr, list(trend = trendn, x = xn), method = "static")

##Dynamic AR* model
mr.dyn <- midas_r(y ~ trend + mls(y, 1:2, 1, "*")
                 + fmls(x, 11, 12, nealmon),
                 start = list(x = rep(0, 3)))

forecast(mr.dyn, list(trend = trendn, x = xn), method = "dynamic")

##Use print, summary and plot methods from package forecast

fmr <- forecast(mr, list(trend = trendn, x = xn), method = "static")
fmr
summary(fmr)
plot(fmr)

```

---

genexp	<i>Generalized exponential MIDAS coefficients</i>
--------	---

---

**Description**

Calculates the MIDAS coefficients for generalized exponential MIDAS lag specification

**Usage**

genexp( $\rho$ ,  $d$ ,  $m$ )

**Arguments**

$\rho$	a vector of parameters
$d$	number of coefficients
$m$	the frequency, currently ignored

**Details**

Generalized exponential MIDAS lag specification is a generalization of exponential Almon lag. It is defined as a product of first order polynomial with exponent of the second order polynomial. This specification was used by V. Kvedaras and V. Zemlys (2012).

**Value**

a vector of coefficients

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

**References**

Kvedaras V., Zemlys, V. *Testing the functional constraints on parameters in regressions with variables of different frequency* Economics Letters 116 (2012) 250-254

---

genexp_gradient	<i>Gradient of generalized exponential MIDAS coefficient generating function</i>
-----------------	--

---

**Description**

Calculates the gradient of generalized exponential MIDAS lag specification

**Usage**

```
genexp_gradient(p, d, m)
```

**Arguments**

p	a vector of parameters
d	number of coefficients
m	the frequency, currently ignored

**Details**

Generalized exponential MIDAS lag specification is a generalization of exponential Almon lag. It is defined as a product of first order polynomial with exponent of the second order polynomial. This specification was used by V. Kvedaras and V. Zemlys (2012).

**Value**

a vector of coefficients

---

gompertzp_gradient	<i>Gradient function for normalized Gompertz probability density function MIDAS weights specification</i>
--------------------	---

---

**Description**

Calculate gradient function for normalized Gompertz probability density function specification of MIDAS weights.

**Usage**

```
gompertzp_gradient(p, d, m)
```

**Arguments**

p	parameters for normalized Gompertz probability density function
d	number of coefficients
m	the frequency ratio, currently ignored

**Value**

vector of coefficients

**Author(s)**

Julius Vainora

---

hAhr_test	<i>Test restrictions on coefficients of MIDAS regression using robust version of the test</i>
-----------	---

---

**Description**

Perform a test whether the restriction on MIDAS regression coefficients holds.

**Usage**

```
hAhr_test(x, PHI = vcovHAC(x$unrestricted, sandwich = FALSE))
```

**Arguments**

**x** MIDAS regression model with restricted coefficients, estimated with `midas_r`  
**PHI** the "meat" covariance matrix, defaults to `vcovHAC(x$unrestricted, sandwich=FALSE)`

**Details**

Given MIDAS regression:

$$y_t = \sum_{j=0}^k \sum_{i=0}^{m-1} \theta_{jm+i} x_{(t-j)m-i} + u_t$$

test the null hypothesis that the following restriction holds:

$$\theta_h = g(h, \lambda),$$

where  $h = 0, \dots, (k+1)m$ .

**Value**

a `htest` object

---

harstep

*HAR(3)-RV model MIDAS weights specification*

---

### Description

HAR(3)-RV model MIDAS weights specification

**Usage**

harstep(p, d, m)

**Arguments**

p                    parameters for Almon lag  
d                    number of the coefficients  
m                    the frequency, currently ignored.

**Details**

MIDAS weights for Heterogeneous Autoregressive model of Realized Volatility (HAR-RV). It is assumed that month has 20 days.

**Value**

vector of coefficients

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

**References**

Corsi, F., *A Simple Approximate Long-Memory Model of Realized Volatility*, Journal of Financial Econometrics Vol. 7 No. 2 (2009) 174-196

---

harstep\_gradient            *Gradient function for HAR(3)-RV model MIDAS weights specification*

---

Corsi, F., *A Simple Approximate Long-Memory Model of Realized Volatility*, Journal of Financial Econometrics Vol. 7 No. 2 (2009) 174-196

---

hf_lags_table	<i>Create a high frequency lag selection table for MIDAS regression model</i>
---------------	---

---

**Description**

Creates a high frequency lag selection table for MIDAS regression model with given information criteria and minimum and maximum lags.

**Usage**

```
hf_lags_table(
  formula,
  data,
  start,
  from,
  to,
  IC = c("AIC", "BIC"),
  test = c("hAh_test"),
  Ofunction = "optim",
  weight_gradients = NULL,
  ...
)
```

**Arguments**

formula	the formula for MIDAS regression, the lag selection is performed for the last MIDAS lag term in the formula
data	a list containing data with mixed frequencies
start	the starting values for optimisation
from	a named list, or named vector with lag numbers which are the beginnings of MIDAS lag structures. The names should correspond to the MIDAS lag terms in the formula for which to do the lag selection. Value NA indicates lag start at zero

imidas\_r

*Restricted MIDAS regression with I(1) regressors***Description**

Estimate restricted MIDAS regression using non-linear least squares, when the regressor is I(1)

**Usage**

```
imidas_r(
  formula,
  data,
  start,
  Ofunction = "optim",
  weight_gradients = NULL,
  ...
)
```

**Arguments**

formula	formula for restricted MIDAS regression. Formula must include <code>fmls</code> function
data	a named list containing data with mixed frequencies
start	the starting values for optimisation. Must be a list with named elements
Ofunction	the list with information which R function to use for optimisation The list must have element named Ofunction which contains character string of chosen R function. Other elements of the list are the arguments passed to this function. The default optimisation function is <code>optim</code> with argument <code>method="BFGS"</code> . Other supported functions are <code>nls</code>
weight_gradients	a named list containing gradient functions of weights. The weight gradient function must return the matrix with dimensions $d_k \times q$ , where $d_k$ and $q$ are the number of coefficients in unrestricted and restricted regressions correspondingly. The names of the list should coincide with the names of weights used in formula. The default value is <code>NULL</code> , which means that the numeric approximation of weight function gradient is calculated. If the argument is not <code>NULL</code> , but the weight used in formula is not present, it is assumed that there exists an R function which has the name of the weight function appended with <code>.gradient</code> .
...	additional arguments supplied to optimisation function

**Details**

Given MIDAS regression:

$$y_t = \sum_{j=0}^k \sum_{i=0}^{m-1} \theta_{jm+i} x_{(t-j)m-i} + \mathbf{z}_t \beta + u_t$$

estimate the parameters of the restriction

$$\theta_h = g(h, \lambda),$$

where  $h = 0, \dots, (k + 1)m$ , together with coefficients  $\beta$  corresponding to additional low frequency regressors.

It is assumed that  $x$  is a I(1) process, hence the special transformation is made. After the transformation `midas_r` is used for estimation.

MIDAS regression involves times series with different frequencies.

The restriction function must return the restricted coefficients of the MIDAS regression.

### Value

a `midas_r` object which is the list with the following elements:

<code>coefficients</code>	the estimates of parameters of restrictions
<code>midas_coefficients</code>	the estimates of MIDAS coefficients of MIDAS regression
<code>model</code>	model data
<code>unrestricted</code>	unrestricted regression estimated using <code>midas_u</code>
<code>term_info</code>	the named list. Each element is a list with the information about the term, such as its frequency, function for weights, gradient function of weights, etc.
<code>fn0</code>	optimisation function for non-linear least squares problem solved in restricted MIDAS regression
<code>rhs</code>	the function which evaluates the right-hand side of the MIDAS regression
<code>gen_midas_coef</code>	the function which generates the MIDAS coefficients of MIDAS regression
<code>opt</code>	the output of optimisation procedure
<code>argmap_opt</code>	the list containing the name of optimisation function together with arguments for optimisation function
<code>start_opt</code>	the starting values used in optimisation
<code>start_list</code>	the starting values as a list
<code>call</code>	the call to the function
<code>terms</code>	terms object
<code>gradient</code>	gradient of NLS objective function
<code>hessian</code>	hessian of NLS objective function
<code>gradD</code>	gradient function of MIDAS weight functions
<code>z_env</code>	the environment in which data is placed
<code>use_gradient</code>	TRUE if user supplied gradient is used, FALSE otherwise
<code>nobs</code>	the number of effective observations
<code>convergence</code>	the convergence message
<code>fitted.values</code>	the fitted values of MIDAS regression
<code>residuals</code>	the residuals of MIDAS regression

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

**See Also**

midas\_r.midas\_r

lcauchyp

*Normalized log-Cauchy probability density function MIDAS weights specification*

---

**Description**

Calculate MIDAS weights according to normalized log-Cauchy probability density function specification

**Usage**

```
lcauchyp(p, d, m)
```

**Arguments**

p parameters for normalized log-Cauchy probability density function  
 d number of coefficients  
 m the frequency ratio, currently ignored

**Value**

vector of coefficients

**Author(s)**

Julius Vainora

---

lcauchyp_gradient	<i>Gradient function for normalized log-Cauchy probability density function MIDAS weights specification</i>
-------------------	---

---

**Description**

Calculate gradient function for normalized log-Cauchy probability density function specification of MIDAS weights.

**Usage**

```
lcauchyp_gradient(p, d, m)
```

**Arguments**

p	parameters for normalized log-Cauchy probability density function
d	number of coefficients
m	the frequency ratio, currently ignored

**Value**

vector of coefficients

**Author(s)**

Julius Vainora

---

lf_lags_table	<i>Create a low frequency lag selection table for MIDAS regression model</i>
---------------	--

---

**Description**

Creates a low frequency lag selection table for MIDAS regression model with given information criteria and minimum and maximum lags.

**Usage**

```
lf_lags_table(
  formula,
  data,
  start,
  from,
  to,
  IC = c("AIC", "BIC"),
  test = c("hAh_test"),
  Ofunction = "optim",
  weight_gradients = NULL,
  ...
)
```

**Arguments**

formula	the formula for MIDAS regression, the lag selection is performed for the last MIDAS lag term in the formula
data	a list containing data with mixed frequencies
start	the starting values for optimisation
from	a named list, or named vector with high frequency (NB!) lag numbers which are the beginnings of MIDAS lag structures. The names should correspond to the MIDAS lag terms in the formula for which to do the lag selection. Value NA indicates lag start at zero
to	a named list where each element is a vector with two elements. The first element is the low frequency lag number from which the lag selection starts, the second is the low frequency lag number at which the lag selection ends. NA indicates lowest (highest) lag numbers possible.
IC	the information criteria which to compute
test	the names of statistical tests to perform on restricted model, p-values are reported in the columns of model selection table
Ofunction	see <a href="#">midasr</a>
weight_gradients	see <a href="#">midas_r</a>
...	additional parameters to optimisation function, see <a href="#">midas_r</a>

**Details**

This function estimates models sequentially increasing the midas lag from `kmin` to `kmax` of the last term of the given formula

**Value**

a `midas_r_ic_table` object which is the list with the following elements:

table	the table where each row contains calculated information criteria for both restricted and unrestricted MIDAS regression model with given lag structure
-------	--

candlist      the list containing fitted models  
 IC             the argument IC

### Author(s)

Virmantas Kvedaras, Vaidotas Zemlys

### Examples

```
data("USunempr")
data("USrealgdp")
y <- diff(log(USrealgdp))
x <- window(diff(USunempr), start=1949)
trend <- 1:length(y)

mlr <- lf_lags_table(y~trend+fmls(x,12,12,nealmon),
                    start=list(x=rep(0,3)),
                    from=c(x=0), to=list(x=c(3,4)))

mlr
```

---

lstr                              *Compute LSTR term for high frequency variable*

---

### Description

Compute LSTR term for high frequency variable

### Usage

```
lstr(X, theta, beta, sd_x = sd(c(X), na.rm = TRUE))
```

### Arguments

X                              matrix, high frequency variable embedded in low frequency, output of mls  
 theta                         vector, restriction coefficients for high frequency variable  
 beta                          vector of length 4, parameters for LSTR term, slope and 3 LSTR parameters  
 sd\_x                         vector of length 1, defaults to standard deviation of X.

### Value

a vector

---

midas_auto_sim	<i>Simulate simple autoregressive MIDAS model</i>
----------------	---

---

### Description

Given the predictor variable, the weights and autoregressive coefficients, simulate MIDAS regression response variable.

### Usage

```
midas_auto_sim(  
  n,  
  alpha,  
  x,  
  theta,  
  rand_gen = rnorm,  
  innov = rand_gen(n, ...),  
  n_start = NA,  
  ...  
)
```

### Arguments

n	sample size.
alpha	autoregressive coefficients.
x	a high frequency predictor variable.
theta	a vector with MIDAS weights for predictor variable.
rand_gen	a function to generate the innovations, default is the normal distribution.
innov	an optional time series of innovations.
n_start	number of observations to omit for the burn.in.
...	additional arguments to function rand_gen.

### Value

a ts object

### Author(s)

Virmantas Kvedaras, Vaidotas Zemlys

**Examples**

```

theta_h0 <- function(p, dk) {
  i <- (1:dk-1)/100
  pol <- p[3]*i + p[4]*i^2
  (p[1] + p[2]*i)*exp(pol)
}

##Generate coefficients
theta0 <- theta_h0(c(-0.1,10,-10,-10),4*12)

##Generate the predictor variable
xx <- ts(arima.sim(model = list(ar = 0.6), 1000 * 12), frequency = 12)

y <- midas_auto_sim(500, 0.5, xx, theta0, n_start = 200)
x <- window(xx, start=start(y))
midas_r(y ~ mls(y, 1, 1) + fmls(x, 4*12-1, 12, theta_h0), start = list(x = c(-0.1, 10, -10, -10)))

```

midas\_lstr\_plain

*LSTR (Logistic Smooth TRansition) MIDAS regression***Description**

Function for fitting LSTR MIDAS regression without the formula interface

**Usage**

```

midas_lstr_plain(
  y,
  X,
  z = NULL,
  weight,
  start_lstr,
  start_x,
  start_z = NULL,
  method = c("Nelder-Mead"),
  ...
)

```

**Arguments**

y	model response
X	prepared matrix of high frequency variable lags for LSTR term
z	additional low frequency variables
weight	the weight function
start_lstr	the starting values for lstr term
start_x	the starting values for weight function

start\_z            the starting values for additional low frequency variables  
 method            a method passed to [optimx](#)  
 ...                additional parameters to [optimx](#)

**Value**

an object similar to midas\_r object

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

---

midas_lstr_sim	<i>Simulate LSTR MIDAS regression model</i>
----------------	---

---

**Description**

Simulate LSTR MIDAS regression model

**Usage**

```
midas_lstr_sim(  
  n,  
  m,  
  theta,  
  intercept,  
  plstr,  
  ar.x,  
  ar.y,  
  rand.gen = rnorm,  
  n.start = NA,  
  ...  
)
```

**Arguments**

n                    number of observations to simulate.  
 m                    integer, frequency ratio  
 theta                vector, restriction coefficients for high frequency variable  
 intercept            vector of length 1, intercept for the model.  
 plstr                vector of length 4, slope for the LSTR term and LSTR parameters  
 ar.x                 vector, AR parameters for simulating high frequency variable  
 ar.y                 vector, AR parameters for AR part of the model  
 rand.gen             function, a function for generating the regression innovations, default is rnorm  
 n.start              integer, length of a 'burn-in' period. If NA, the default, a reasonable value is computed.  
 ...                  additional parameters to rand.gen

**Value**

a list

**Examples**

```
nnbeta <- function(p, k) nbeta(c(1, p), k)

dgp <- midas_lstr_sim(250,
  m = 12, theta = nnbeta(c(2, 4), 24),
  intercept = c(1), plstr = c(1.5, 1, log(1), 1),
  ar.x = 0.9, ar.y = 0.5, n.start = 100
)

z <- cbind(1, mls(dgp$y, 1:2, 1))
colnames(z) <- c("Intercept", "y1", "y2")
X <- mls(dgp$x, 0:23, 12)

lstr_mod <- midas_lstr_plain(dgp$y, X, z, nnbeta,
  start_lstr = c(1.5, 1, 1, 1),
  start_x = c(2, 4), start_z = c(1, 0.5, 0)
)

coef(lstr_mod)
```

---

midas\_mmm\_plain

*MMM (Mean-Min-Max) MIDAS regression*

---

**Description**

Function for fitting MMM MIDAS regression without the formula interface

**Usage**

```
midas_mmm_plain(
  y,
  X,
  z = NULL,
  weight,
  start_mmm,
  start_x,
  start_z = NULL,
  method = c("Nelder-Mead"),
  ...
)
```

**Arguments**

y	model response
X	prepared matrix of high frequency variable lags for MMM term
z	additional low frequency variables
weight	the weight function
start_mmm	the starting values for MMM term
start_x	the starting values for weight function
start_z	the starting values for additional low frequency variables
method	a method passed to <a href="#">optimx</a>
...	additional parameters to <a href="#">optimx</a>

**Value**

an object similar to `midas_r` object

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

---

midas\_mmm\_sim

*Simulate MMM MIDAS regression model*

---

**Description**

Simulate MMM MIDAS regression model

**Usage**

```
midas_mmm_sim(  
  n,  
  m,  
  theta,  
  intercept,  
  pmmm,  
  ar.x,  
  ar.y,  
  rand.gen = rnorm,  
  n.start = NA,  
  ...  
)
```

**Arguments**

n	number of observations to simulate.
m	integer, frequency ratio
theta	vector, restriction coefficients for high frequency variable
intercept	vector of length 1, intercept for the model.
pmmm	vector of length 2, slope for the MMM term and MMM parameter
ar.x	vector, AR parameters for simulating high frequency variable
ar.y	vector, AR parameters for AR part of the model
rand.gen	function, a function for generating the regression innovations, default is rnorm
n.start	integer, length of a 'burn-in' period. If NA, the default, a reasonable value is computed.
...	additional parameters to rand.gen

**Value**

a list

**Examples**

```

nnbeta <- function(p, k) nbeta(c(1, p), k)

dgp <- midas_mmm_sim(250,
  m = 12, theta = nnbeta(c(2, 4), 24),
  intercept = c(1), pmmm = c(1.5, 1),
  ar.x = 0.9, ar.y = 0.5, n.start = 100
)

z <- cbind(1, mls(dgp$y, 1:2, 1))
colnames(z) <- c("Intercept", "y1", "y2")
X <- mls(dgp$x, 0:23, 12)

mmm_mod <- midas_mmm_plain(dgp$y, X, z, nnbeta,
  start_mmm = c(1.5, 1),
  start_x = c(2, 4), start_z = c(1, 0.5, 0)
)

coef(mmm_mod)

```

**Description**

Estimate restricted MIDAS regression using non-linear least squares.

**Usage**

```
midas_nlpr(formula, data, start, Ofunction = "optim", ...)
```

**Arguments**

formula	formula for restricted MIDAS regression or <code>midas_r</code> object. Formula must include <code>fmls</code> function
data	a named list containing data with mixed frequencies
start	the starting values for optimisation. Must be a list with named elements.
Ofunction	the list with information which R function to use for optimisation. The list must have element named <code>Ofunction</code> which contains character string of chosen R function. Other elements of the list are the arguments passed to this function. The default optimisation function is <code>optim</code> with arguments <code>method="Nelder-Mead"</code> and <code>control=list(maxit=5000)</code> . Other supported functions are <code>nls</code> , <code>optimx</code> .
...	additional arguments supplied to optimisation function

**Details**

Given MIDAS regression:

$$y_t = \sum_{j=1}^p \alpha_j y_{t-j} + \sum_{i=0}^k \sum_{j=0}^{l_i} \beta_j^{(i)} x_{tm_i-j}^{(i)} + u_t,$$

estimate the parameters of the restriction

$$\beta_j^{(i)} = g^{(i)}(j, \lambda).$$

Such model is a generalisation of so called ADL-MIDAS regression. It is not required that all the coefficients should be restricted, i.e the function  $g^{(i)}$  might be an identity function. Model with no restrictions is called U-MIDAS model. The regressors  $x_{\tau}^{(i)}$  must be of higher (or of the same) frequency as the dependent variable  $y_t$ .

**Value**

a `midas_r` object which is the list with the following elements:

coefficients	the estimates of parameters of restrictions
midas_coefficients	the estimates of MIDAS coefficients of MIDAS regression
model	model data
unrestricted	unrestricted regression estimated using <code>midas_u</code>
term_info	the named list. Each element is a list with the information about the term, such as its frequency, function for weights, gradient function of weights, etc.
fn0	optimisation function for non-linear least squares problem solved in restricted MIDAS regression

rhs	the function which evaluates the right-hand side of the MIDAS regression
gen_midas_coef	the function which generates the MIDAS coefficients of MIDAS regression
opt	the output of optimisation procedure
argmap_opt	the list containing the name of optimisation function together with arguments for optimisation function
start_opt	the starting values used in optimisation
start_list	the starting values as a list
call	the call to the function
terms	terms object
gradient	gradient of NLS objective function
hessian	hessian of NLS objective function
gradD	gradient function of MIDAS weight functions
Zenv	the environment in which data is placed
nobs	the number of effective observations
convergence	the convergence message
fitted.values	the fitted values of MIDAS regression
residuals	the residuals of MIDAS regression

midas\_pl\_plain                    *MIDAS Partially linear non-parametric regression*

---

### Description

Function for fitting PL MIDAS regression without the formula interface

### Usage

```
midas_pl_plain(
  y,
  X,
  z,
  p.ar = NULL,
  weight,
  degree = 1,
  start_bws,
  start_x,
  start_ar = NULL,
  method = c("Nelder-Mead"),
  ...
)
```

### Arguments

y	model response
X	prepared matrix of high frequency variable lags for MMM term
z	a vector, data for the non-parametric part
p.ar	length of AR part
weight	the weight function
degree	the degree of local polynomial
start_bws	the starting values bandwidth
start_x	the starting values for weight function
start_ar	the starting values for AR part. Should be the same length as p
method	a method passed to <a href="#">optim</a>
...	additional parameters to <a href="#">optim</a>

### Value

an object similar to midas\_r object

### Author(s)

Virmantas Kvedaras, Vaidotas Zemlys

---

midas_pl_sim	<i>Simulate PL MIDAS regression model</i>
--------------	---

---

**Description**

Simulate PL MIDAS regression model

**Usage**

```
midas_pl_sim(
  n,
  m,
  theta,
  gfun,
  ar.x,
  ar.y,
  rand.gen = rnorm,
  n.start = NA,
  ...
)
```

**Arguments**

n	number of observations to simulate.
m	integer, frequency ratio
theta	vector, restriction coefficients for high frequency variable
gfun	function, a function which takes a single index
ar.x	vector, AR parameters for simulating high frequency variable
ar.y	vector, AR parameters for AR part of the model
rand.gen	function, a function for generating the regression innovations, default is rnorm
n.start	integer, length of a 'burn-in' period. If NA, the default, a reasonable value is computed.
...	additional parameters to rand.gen

**Value**

a list

**Examples**

```
nnbeta <- function(p, k) nbeta(c(1, p), k)

dgp <- midas_pl_sim(250,
  m = 12, theta = nnbeta(c(2, 4), 24),
  gfun = function(x) 0.25 * x^3,
  ar.x = 0.9, ar.y = 0.5, n.start = 100
)
```

midas\_qr

*Restricted MIDAS quantile regression***Description**

Estimate restricted MIDAS quantile regression using nonlinear quantile regression

**Usage**

```
midas_qr(
  formula,
  data,
  tau = 0.5,
  start,
  Ofunction = "nlrq",
  weight_gradients = NULL,
  guess_start = TRUE,
  ...
)
```

**Arguments**

formula	formula for restricted MIDAS regression or midas_qr object. Formula must include <code>mls</code> function
data	a named list containing data with mixed frequencies
tau	quantile
start	the starting values for optimisation. Must be a list with named elements.
Ofunction	the list with information which R function to use for optimisation. The list must have element named Ofunction which contains character string of chosen R function. Other elements of the list are the arguments passed to this function. The default optimisation function is <code>optim</code> with argument <code>method="BFGS"</code> . Other supported functions are <code>nlm</code>
weight_gradients	a named list containing gradient functions of weights. The weight gradient function must return the matrix with dimensions $d_k \times q$ , where $d_k$ and $q$ are the number of coefficients in unrestricted and restricted regressions correspondingly. The names of the list should coincide with the names of weights used in formula. The default value is <code>NULL</code> , which means that the numeric approximation of weight function gradient is calculated. If the argument is not <code>NULL</code> , but the name of the weight used in formula is not present, it is assumed that there exists an R function which has the name of the weight function appended with <code>_gradient</code> .
guess_start	logical, if <code>TRUE</code> tries certain strategy to improve starting values
...	additional arguments supplied to optimisation function

**Value**

a `midas_r` object which is the list with the following elements:

<code>coefficients</code>	the estimates of parameters of restrictions
<code>midas_coefficients</code>	the estimates of MIDAS coefficients of MIDAS regression
<code>model</code>	model data
<code>unrestricted</code>	unrestricted regression estimated using <code>midas_u</code>
<code>term_info</code>	the named list. Each element is a list with the information about the term, such as its frequency, function for weights, gradient function of weights, etc.
<code>fn0</code>	optimisation function for non-linear least squares problem solved in restricted MIDAS regression
<code>rhs</code>	the function which evaluates the right-hand side of the MIDAS regression
<code>gen_midas_coef</code>	the function which generates the MIDAS coefficients of MIDAS regression
<code>opt</code>	the output of optimisation procedure
<code>argmap_opt</code>	the list containing the name of optimisation function together with arguments for optimisation function
<code>start_opt</code>	the starting values used in optimisation
<code>start_list</code>	the starting values as a list
<code>call</code>	the call to the function
<code>terms</code>	terms object
<code>gradient</code>	gradient of NLS objective function
<code>hessian</code>	hessian of NLS objective function
<code>gradD</code>	gradient function of MIDAS weight functions
<code>Zenv</code>	the environment in which data is placed
<code>use_gradient</code>	TRUE if user supplied gradient is used, FALSE otherwise
<code>nobs</code>	the number of effective observations
<code>convergence</code>	the convergence message
<code>fitted.values</code>	the fitted values of MIDAS regression
<code>residuals</code>	the residuals of MIDAS regression

**Author(s)**

Vaidotas Zemlys-Balevicius

**Examples**

```
##Take the same example as in midas_r

theta_h0 <- function(p, dk, ...) {
  i <- (1:dk-1)/100
  pol <- p[3]*i + p[4]*i^2
```

```

      (p[1] + p[2]*i)*exp(pol)
    }

##Generate coefficients
theta0 <- theta_h0(c(-0.1,10,-10,-10),4*12)

##Plot the coefficients
plot(theta0)

##Generate the predictor variable
xx <- ts(arima.sim(model = list(ar = 0.6), 600 * 12), frequency = 12)

##Simulate the response variable
y <- midas_sim(500, xx, theta0)

x <- window(xx, start=start(y))

##Fit quantile regression. All the coefficients except intercept should be constant.
##Intercept coefficient should correspond to quantile function of regression errors.
mr <- midas_qr(y~fmls(x,4*12-1,12,theta_h0), tau = c(0.1, 0.5, 0.9),
              list(y=y,x=x),
              start=list(x=c(-0.1,10,-10,-10)))

mr

```

---

midas\_r

*Restricted MIDAS regression*

---

## Description

Estimate restricted MIDAS regression using non-linear least squares.

## Usage

```

midas_r(
  formula,
  data,
  start,
  Ofunction = "optim",
  weight_gradients = NULL,
  ...
)

```

## Arguments

formula	formula for restricted MIDAS regression or midas_r object. Formula must include <code>fmls</code> function
data	a named list containing data with mixed frequencies
start	the starting values for optimisation. Must be a list with named elements.

<code>Ofunction</code>	the list with information which R function to use for optimisation. The list must have element named <code>Ofunction</code> which contains character string of chosen R function. Other elements of the list are the arguments passed to this function. The default optimisation function is <code>optim</code> with argument <code>method="BFGS"</code> . Other supported functions are <code>nls</code>
<code>weight_gradients</code>	a named list containing gradient functions of weights. The weight gradient function must return the matrix with dimensions $d_k \times q$ , where $d_k$ and $q$ are the number of coefficients in unrestricted and restricted regressions correspondingly. The names of the list should coincide with the names of weights used in formula. The default value is <code>NULL</code> , which means that the numeric approximation of weight function gradient is calculated. If the argument is not <code>NULL</code> , but the name of the weight used in formula is not present, it is assumed that there exists an R function which has the name of the weight function appended with <code>_gradient</code> .
<code>...</code>	additional arguments supplied to optimisation function

## Details

Given MIDAS regression:

$$y_t = \sum_{j=1}^p \alpha_j y_{t-j} + \sum_{i=0}^k \sum_{j=0}^{l_i} \beta_j^{(i)} x_{tm_i-j}^{(i)} + u_t,$$

estimate the parameters of the restriction

$$\beta_j^{(i)} = g^{(i)}(j, \lambda).$$

Such model is a generalisation of so called ADL-MIDAS regression. It is not required that all the coefficients should be restricted, i.e the function  $g^{(i)}$  might be an identity function. Model with no restrictions is called U-MIDAS model. The regressors  $x_{\tau}^{(i)}$  must be of higher (or of the same) frequency as the dependent variable  $y_t$ .

MIDAS-AR\* (a model with a common factor, see (Clements and Galvao, 2008)) can be estimated by specifying additional argument, see an example.

The restriction function must return the restricted coefficients of the MIDAS regression.

## Value

a `midas_r` object which is the list with the following elements:

<code>coefficients</code>	the estimates of parameters of restrictions
<code>midas_coefficients</code>	the estimates of MIDAS coefficients of MIDAS regression
<code>model</code>	model data
<code>unrestricted</code>	unrestricted regression estimated using <code>midas_u</code>

term_info	the named list. Each element is a list with the information about the term, such as its frequency, function for weights, gradient function of weights, etc.
fn0	optimisation function for non-linear least squares problem solved in restricted MIDAS regression
rhs	the function which evaluates the right-hand side of the MIDAS regression
gen_midas_coef	the function which generates the MIDAS coefficients of MIDAS regression
opt	the output of optimisation procedure
argmap_opt	the list containing the name of optimisation function together with arguments for optimisation function
start_opt	the starting values used in optimisation
start_list	the starting values as a list
call	the call to the function
terms	terms object
gradient	gradient of NLS objective function
hessian	hessian of NLS objective function
gradD	gradient function of MIDAS weight functions
Zenv	the environment in which data is placed
use_gradient	TRUE if user supplied gradient is used, FALSE otherwise
nobs	the number of effective observations
convergence	the convergence message
fitted.values	the fitted values of MIDAS regression
residuals	the residuals of MIDAS regression

midas_r_ic_table	<i>Create a weight and lag selection table for MIDAS regression model</i>
------------------	---

---

**Description**

Creates a weight and lag selection table for MIDAS regression model with given information criteria and minimum and maximum lags.

**Usage**

```
midas_r_ic_table(
  formula,
  data = NULL,
  start = NULL,
  table,
  IC = c("AIC", "BIC"),
  test = c("hAh_test"),
  Ofunction = "optim",
  weight_gradients = NULL,
  show_progress = TRUE,
  ...
)
```

**Arguments**

formula	the formula for MIDAS regression, the lag selection is performed for the last MIDAS lag term in the formula
data	a list containing data with mixed frequencies
start	the starting values for optimisation excluding the starting values for the last term
table	an wls_table object, see <a href="#">expand_weights_lags</a>
IC	the names of information criteria which to compute
test	the names of statistical tests to perform on restricted model, p-values are reported in the columns of model selection table
Ofunction	see <a href="#">midasr</a>

weight\_gradients  
                                   see [midas\\_r](#)

show\_progress   logical, TRUE to show progress bar, FALSE for silent evaluation

...               additional parameters to optimisation function, see [midas\\_r](#)

## Details

This function estimates models sequentially increasing the midas lag from `kmin` to `kmax` and varying the weights of the last term of the given formula

## Value

a `midas_r_ic_table` object which is the list with the following elements:

`table`           the table where each row contains calculated information criteria for both restricted and unrestricted MIDAS regression model with given lag structure

`candlist`       the list containing fitted models

`IC`             the argument `IC`

## Author(s)

Virmantas Kvedaras, Vaidotas Zemlys

## Examples

```
data("USunempr")
data("USrealgdp")
y <- diff(log(USrealgdp))
x <- window(diff(USunempr), start=1949)
trend <- 1:length(y)

mwlr <- midas_r_ic_table(y~trend+fmls(x,12,12,nealmon),
  table=list(x=list(weights=
    as.list(c("nealmon", "nealmon", "nbeta")),
    lags=list(0:4, 0:5, 0:6),
    starts=list(rep(0,3), rep(0,3), c(1,1,1,0))))))

mwlr
```

---

`midas_r_np`*Estimate non-parametric MIDAS regression*

---

**Description**

Estimates non-parametric MIDAS regression

**Usage**

```
midas_r_np(formula, data, lambda = NULL)
```

**Arguments**

<code>formula</code>	formula specifying MIDAS regression
<code>data</code>	a named list containing data with mixed frequencies
<code>lambda</code>	smoothing parameter, defaults to NULL, which means that it is chosen by minimising AIC.

**Details**

Estimates non-parametric MIDAS regression according to Breitung et al.

**Value**

a `midas_r_np` object

**Author(s)**

Vaidotas Zemlys

**References**

Breitung J, Roling C, Elengikal S (2013). *Forecasting inflation rates using daily data: A non-parametric MIDAS approach* Working paper, URL <http://www.ect.uni-bonn.de/mitarbeiter/joerg-breitung/npmidas>.

**Examples**

```
data("USunempr")
data("USrealgdp")
y <- diff(log(USrealgdp))
x <- window(diff(USunempr), start=1949)
trend <- 1:length(y)
midas_r_np(y~trend+fm1s(x,12,12))
```

---

midas\_r\_plain                      *Restricted MIDAS regression*

---

### Description

Function for fitting MIDAS regression without the formula interface

### Usage

```
midas_r_plain(  
  y,  
  X,  
  z = NULL,  
  weight,  
  grw = NULL,  
  startx,  
  startz = NULL,  
  method = c("Nelder-Mead", "BFGS"),  
  ...  
)
```

### Arguments

y	model response
X	prepared matrix of high frequency variable lags
z	additional low frequency variables
weight	the weight function
grw	the gradient of weight function
startx	the starting values for weight function
startz	the starting values for additional low frequency variables
method	a method passed to <a href="#">optimx</a>
...	additional parameters to <a href="#">optimx</a>

### Value

an object similar to `midas_r` object

### Author(s)

Virmantas Kvedaras, Vaidotas Zemlys

**Examples**

```

data("USunempr")
data("USrealgdp")
y <- diff(log(USrealgdp))
x <- window(diff(USunempr),start=1949)
trend <- 1:length(y)

X<-fmls(x,11,12)

midas_r_plain(y,X,trend,weight=nealmon,startx=c(0,0,0))

```

midas\_sim

*Simulate simple MIDAS regression response variable***Description**

Given the predictor variable and the coefficients simulate MIDAS regression response variable.

**Usage**

```
midas_sim(n, x, theta, rand_gen = rnorm, innov = rand_gen(n, ...), ...)
```

**Arguments**

n	The sample size
x	a ts object with MIDAS regression predictor variable
theta	a vector with MIDAS regression coefficients
rand_gen	the function which generates the sample of innovations, the default is <code>rnorm</code>
innov	the vector with innovations, the default is NULL, i.e. innovations are generated using argument <code>rand_gen</code>
...	additional arguments to <code>rand_gen</code> .

**Details**

MIDAS regression with one predictor variable has the following form:

$$y_t = \sum_{j=0}^h \theta_j x_{tm-j} + u_t,$$

where  $m$  is the frequency ratio and  $h$  is the number of high frequency lags included in the regression.

MIDAS regression involves times series with different frequencies. In R the frequency property is set when creating time series objects `ts`. Hence the frequency ratio  $m$  which figures in MIDAS regression is calculated from frequency property of time series objects supplied.

**Value**

a ts object

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

**Examples**

```
##The parameter function
theta_h0 <- function(p, dk) {
  i <- (1:dk-1)/100
  pol <- p[3]*i + p[4]*i^2
  (p[1] + p[2]*i)*exp(pol)
}

##Generate coefficients
theta0 <- theta_h0(c(-0.1,10,-10,-10),4*12)

##Plot the coefficients
plot(theta0)

##Generate the predictor variable, leave 4 low frequency lags of data for burn-in.
xx <- ts(arima.sim(model = list(ar = 0.6), 600 * 12), frequency = 12)

##Simulate the response variable
y <- midas_sim(500, xx, theta0)

x <- window(xx, start=start(y))
midas_r(y ~ mls(y, 1, 1) + fmls(x, 4*12-1, 12, theta_h0), start = list(x = c(-0.1, 10, -10, -10)))
```

---

midas\_si\_plain

---

MIDAS Single index regression

---

**Description**

Function for fitting SI MIDAS regression without the formula interface

**Usage**

```
midas_si_plain(
  y,
  X,
  p.ar = NULL,
  weight,
  degree = 1,
  start_bws,
  start_x,
```

```

    start_ar = NULL,
    method = "Nelder-Mead",
    ...
  )

```

### Arguments

y	model response
X	prepared matrix of high frequency variable lags for MMM term
p.ar	length of AR part
weight	the weight function
degree	the degree of local polynomial
start_bws	the starting values bandwidth
start_x	the starting values for weight function
start_ar	the starting values for AR part. Should be the same length as p
method	a method passed to <a href="#">optim</a> , defaults to Nelder-Mead
...	additional parameters to <a href="#">optim</a>

### Value

an object similar to `midas_r` object

### Author(s)

Virmantas Kvedaras, Vaidotas Zemlys

---

midas\_si\_sim

*Simulate SI MIDAS regression model*

---

### Description

Simulate SI MIDAS regression model

### Usage

```

midas_si_sim(
  n,
  m,
  theta,
  gfun,
  ar.x,
  ar.y,
  rand.gen = rnorm,
  n.start = NA,
  ...
)

```

**Arguments**

n	number of observations to simulate.
m	integer, frequency ratio
theta	vector, restriction coefficients for high frequency variable
gfun	function, a function which takes a single index
ar.x	vector, AR parameters for simulating high frequency variable
ar.y	vector, AR parameters for AR part of the model
rand.gen	function, a function for generating the regression innovations, default is rnorm
n.start	integer, length of a 'burn-in' period. If NA, the default, a reasonable value is computed.
...	additional parameters to rand.gen

**Value**

a list

**Examples**

```

nbeta <- function(p, k) nbeta(c(1, p), k)

dgp <- midas_si_sim(250,
  m = 12, theta = nbeta(c(2, 4), 24),
  gfun = function(x) 0.03 * x^3,
  ar.x = 0.9, ar.y = 0.5, n.start = 100
)

```

---

midas\_sp

*Semi-parametric MIDAS regression*

---

**Description**

Estimate semi-parametric MIDAS regression using non-linear least squares.

**Usage**

```
midas_sp(formula, data, bws, start, degree = 1, ofunction = "optim", ...)
```

**Arguments**

formula	formula for restricted MIDAS regression or midas_r object. Formula must include <code>fmls</code> function
data	a named list containing data with mixed frequencies
bws	a bandwidth specification. Note you need to supply logarithm value of the bandwidth.

start	the starting values for optimisation. Must be a list with named elements.
degree	the degree of local polynomial. 0 corresponds to local-constant, 1 local-linear. For univariate models higher values can be provided.
Ofunction	the list with information which R function to use for optimisation. The list must have element named Ofunction which contains character string of chosen R function. Other elements of the list are the arguments passed to this function. The default optimisation function is <code>optimx</code> with arguments <code>method="Nelder-Mead"</code> and <code>control=list(maxit=5000)</code> . Other supported functions are <code>nls</code> , <code>optimx</code> .
...	additional arguments supplied to optimisation function

### Details

Given MIDAS regression:

$$y_t = \sum_{j=1}^p \alpha_j y_{t-j} + \sum_{i=0}^k \sum_{j=0}^{l_i} \beta_j^{(i)} x_{tm_i-j}^{(i)} + u_t,$$

estimate the parameters of the restriction

$$\beta_j^{(i)} = g^{(i)}(j, \lambda).$$

Such model is a generalisation of so called ADL-MIDAS regression. It is not required that all the coefficients should be restricted, i.e the function  $g^{(i)}$  might be an identity function. The regressors  $x_{\tau}^{(i)}$  must be of higher (or of the same) frequency as the dependent variable  $y_t$ .

### Value

a `midas_sp` object which is the list with the following elements:

coefficients	the estimates of parameters of restrictions
midas_coefficients	the estimates of MIDAS coefficients of MIDAS regression
model	model data
unrestricted	unrestricted regression estimated using <code>midas_u</code>
term_info	the named list. Each element is a list with the information about the term, such as its frequency, function for weights, gradient function of weights, etc.
fn0	optimisation function for non-linear least squares problem solved in restricted MIDAS regression
rhs	the function which evaluates the right-hand side of the MIDAS regression
gen_midas_coef	the function which generates the MIDAS coefficients of MIDAS regression
opt	the output of optimisation procedure
argmap_opt	the list containing the name of optimisation function together with arguments for optimisation function
start_opt	the starting values used in optimisation

start_list	the starting values as a list
call	the call to the function
terms	terms object
gradient	gradient of NLS objective function
hessian	hessian of NLS objective function
gradD	gradient function of MIDAS weight functions
Zenv	the environment in which data is placed
nobs	the number of effective observations
convergence	the convergence message
fitted.values	the fitted values of MIDAS regression
residuals	the residuals of MIDAS regression

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys-Balevičius

---

midas\_u

---

*Estimate unrestricted MIDAS regression*

---

**Description**

Estimate unrestricted MIDAS regression using OLS. This function is a wrapper for `lm`.

**Usage**

```
midas_u(formula, data, ...)
```

**Arguments**

formula	MIDAS regression model formula
data	a named list containing data with mixed frequencies
...	further arguments, which could be passed to <code>lm</code> function.

**Details**

MIDAS regression has the following form:

$$y_t = \sum_{j=1}^p \alpha_j y_{t-j} + \sum_{i=0}^k \sum_{j=0}^{l_i} \beta_j^{(i)} x_{tm_i-j}^{(i)} + u_t,$$

where  $x_{\tau}^{(i)}$ ,  $i = 0, \dots, k$  are regressors of higher (or similar) frequency than  $y_t$ . Given certain assumptions the coefficients can be estimated using usual OLS and they have the familiar properties associated with simple linear regression.

**Value**

lm object.

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

**Examples**

```
##The parameter function
theta_h0 <- function(p, dk, ...) {
  i <- (1:dk-1)/100
  pol <- p[3]*i + p[4]*i^2
  (p[1] + p[2]*i)*exp(pol)
}

##Generate coefficients
theta0 <- theta_h0(c(-0.1,10,-10,-10),4*12)

##Plot the coefficients
##Do not run
#plot(theta0)

##' ##Generate the predictor variable
xx <- ts(arima.sim(model = list(ar = 0.6), 600 * 12), frequency = 12)

##Simulate the response variable
y <- midas_sim(500, xx, theta0)

x <- window(xx, start=start(y))

##Create low frequency data.frame
ldt <- data.frame(y=y,trend=1:length(y))

##Create high frequency data.frame

hdt <- data.frame(x=window(x, start=start(y)))

##Fit unrestricted model
mu <- midas_u(y~fmls(x,2,12)-1, list(ldt, hdt))

##Include intercept and trend in regression

mu_it <- midas_u(y~fmls(x,2,12)+trend, list(ldt, hdt))

##Pass data as partialy named list
```

```
mu_it <- midas_u(y~fmIs(x,2,12)+trend, list(lDt, x=hdT$x))
```

---

mIs *MIDAS lag structure*

---

## Description

Create a matrix of selected MIDAS lags

## Usage

```
mIs(x, k, m, ...)
```

## Arguments

x	a vector
k	a vector of lag orders, zero denotes contemporaneous lag.
m	frequency ratio
...	further arguments used in fitting MIDAS regression

## Details

The function checks whether high frequency data is complete, i.e. m must divide length(x).

## Value

a matrix containing the lags

## Author(s)

Virmantas Kvedaras, Vaidotas Zemlys

## Examples

```
## Quarterly frequency data
x <- 1:16
## Create MIDAS lag for use with yearly data
mIs(x,0:3,4)

## Do not use contemporaneous lag
mIs(x,1:3,4)

## Compares with embed when m=1
embed(x,2)
mIs(x,0:1,1)
```

---

`mlsd`*MIDAS lag structure with dates*

---

**Description**

MIDAS lag structure with dates

**Usage**

```
mlsd(x, k, y, ...)
```

**Arguments**

<code>x</code>	a vector, of high frequency time series. Must be zoo or ts object
<code>k</code>	lags, a vector
<code>y</code>	a vector of low frequency time series. Must be zoo or ts object
<code>...</code>	further arguments used in fitting MIDAS regression

**Details**

High frequency time series is aligned with low frequency time series using date information. Then the high frequency lags are calculated.

To align the time series the low frequency series index needs to be extended by one low frequency period into the past and into the future. If supplied time series object does not support extending time index, a simple heuristic is used.

It is expected that time index for zoo objects can be converted to POSIXct format.

**Value**

a matrix containing the lags

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys-Balevičius

**Examples**

```
# Example with ts objects
x <- ts(c(1:144), start = c(1980, 1), frequency = 12)
y <- ts(c(1:12), start = 1980, frequency = 1)

# msl and mls should give the same results

m1 <- msl(x, 0:5, y)

m2 <- mls(x, 0:5, 12)
```

```

sum(abs(m1 - m2))

# Example with zooreg

# Convert x to zooreg object using yearmon time index
## Not run:
xz <- zoo::as.zooreg(x)

yz <- zoo::zoo(as.numeric(y), order.by = as.Date(paste0(1980 + 0:11, "-01-01")))

# Heuristic works here
m3 <- mlsd(xz, 0:5, yz)

sum(abs(m3 - m1))

## End(Not run)

```

---

mmm

---

*Compute MMM term for high frequency variable*

---

## Description

Compute MMM term for high frequency variable

## Usage

```
mmm(X, theta, beta, ...)
```

## Arguments

X	matrix, high frequency variable embedded in low frequency, output of mls
theta	vector, restriction coefficients for high frequency variable
beta	vector of length 2, parameters for MMM term, slope and MMM parameter.
...	currently not used

## Value

a vector

---

`modsel`*Select the model based on given information criteria*

---

### Description

Selects the model with minimum of given information criteria and model type

### Usage

```
modsel(  
  x,  
  IC = x$IC[1],  
  test = x$test[1],  
  type = c("restricted", "unrestricted"),  
  print = TRUE  
)
```

### Arguments

<code>x</code>	a <a href="#">midas_r_ic_table</a> object
<code>IC</code>	the name of information criteria to base the choosing of the model
<code>test</code>	the name of the test for which to print out the p-value
<code>type</code>	the type of MIDAS model, either restricted or unrestricted
<code>print</code>	logical, if TRUE, prints the summary of the best model.

### Details

This function selects the model from the model selection table for which the chosen information criteria achieves the smallest value. The function works with model tables produced by functions [lf\\_lags\\_table](#), [hf\\_lags\\_table](#), [amidas\\_table](#) and [midas\\_r\\_ic\\_table](#).

### Value

(invisibly) the best model based on information criteria, [midas\\_r](#) object

### Author(s)

Virmantas Kvedaras, Vaidotas Zemlys

### Examples

```
data("USunempr")  
data("USrealgdp")  
y <- diff(log(USrealgdp))  
x <- window(diff(USunempr), start=1949)  
trend <- 1:length(y)
```

```

mhfr <- hf_lags_table(y~trend+fmls(x,12,12,nealmon),
                     start=list(x=rep(0,3)),
                     from=list(x=0),to=list(x=c(4,6)))

mlfr <- lf_lags_table(y~trend+fmls(x,12,12,nealmon),
                     start=list(x=rep(0,3)),
                     from=list(x=0),to=list(x=c(2,3)))

modsel(mhfr,"BIC","unrestricted")

modsel(mlfr,"BIC","unrestricted")

nealmon

*Normalized Exponential Almon lag MIDAS coefficients*

**Description**

Calculate normalized exponential Almon lag coefficients given the parameters and required number of coefficients.

**Usage**

nealmon(p, d, m)

**Arguments**

p                    parameters for Almon lag  
 d                    number of the coefficients  
 m                    the frequency, currently ignored.

**Details**

Given unrestricted MIDAS regression

$$y_t = \sum_{h=0}^d \theta_h x_{tm-h} + \mathbf{z}_t \beta + u_t$$

normalized exponential Almon lag restricts the coefficients  $\theta_h$  in the following way:

$$\theta_h = \delta \frac{\exp(\lambda_1(h+1) + \dots + \lambda_r(h+1)^r)}{\sum_{s=0}^d \exp(\lambda_1(s+1) + \dots + \lambda_r(s+1)^r)}$$

The parameter  $\delta$  should be the first element in vector p. The degree of the polynomial is then decided by the number of the remaining parameters.

**Value**

vector of coefficients

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

**Examples**

```
##Load data
data("USunempr")
data("USrealgdp")

y <- diff(log(USrealgdp))
x <- window(diff(USunempr), start=1949)
t <- 1:length(y)

midas_r(y~t+fmls(x,11,12,nealmon), start=list(x=c(0,0,0)))
```

---

`nealmon_gradient`*Gradient function for normalized exponential Almon lag weights*

---

**Description**

Gradient function for normalized exponential Almon lag weights

**Usage**

```
nealmon_gradient(p, d, m)
```

**Arguments**

p	hyperparameters for Almon lag
d	number of coefficients
m	the frequency ratio, currently ignored

**Value**

the gradient matrix

**Author(s)**

Vaidotas Zemlys

oos\_prec

*Out-of-sample prediction precision data on simulation example***Description**

The code in the example generates the out-of-sample prediction precision data for correctly and incorrectly constrained MIDAS regression model compared to unconstrained MIDAS regression model.

**Format**

A data.frame object with four columns. The first column indicates the sample size, the second the type of constraint, the third the value of the precision measure and the fourth the type of precision measure.

**Examples**

```
## Do not run:
## set.seed(1001)

```

---

plot\_lstr

*Plot MIDAS coefficients*

---

## Description

Plots logistic function for LSTR MIDAS regression

## Usage

```
plot_lstr(x, term_name, title = NULL, compare = NULL, ...)
```

## Arguments

x	midas_r object
term_name	the term name for which the coefficients are plotted. Default is NULL, which selects the first MIDAS term
title	the title string of the graph. The default is NULL for the default title.
compare	the parameters for weight function to compare with the model, default is NULL
...	not used

**Details**

Plots logistic function for LSTR MIDAS regression of unrestricted MIDAS regression

**Value**

a data frame with restricted MIDAS coefficients, unrestricted MIDAS coefficients and lower and upper confidence interval limits. The data frame is returned invisibly.

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

---

plot_midas_coef	<i>Plot MIDAS coefficients</i>
-----------------	--------------------------------

---

**Description**

Plots MIDAS coefficients of a MIDAS regression for a selected term.

**Usage**

```
plot_midas_coef(x, term_name, title, ...)

## S3 method for class 'midas_r'
plot_midas_coef(
  x,
  term_name = NULL,
  title = NULL,
  vcov. = sandwich,
  unrestricted = x$unrestricted,
  ...
)
```

**Arguments**

x	midas_r object
term_name	the term name for which the coefficients are plotted. Default is NULL, which selects the first MIDAS term
title	the title string of the graph. The default is NULL for the default title.
...	additional arguments passed to vcov.
vcov.	the covariance matrix to calculate the standard deviation of the coefficients
unrestricted	the unrestricted model, the default is unrestricted model from the x object. Set NULL to plot only the weights.

**Details**

Plots MIDAS coefficients of a selected MIDAS regression term together with corresponding MIDAS coefficients and their confidence intervals of unrestricted MIDAS regression

**Value**

a data frame with restricted MIDAS coefficients, unrestricted MIDAS coefficients and lower and upper confidence interval limits. The data frame is returned invisibly.

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

**Examples**

```
data("USrealgdp")
data("USunempr")

y <- diff(log(USrealgdp))
x <- window(diff(USunempr), start = 1949)
trend <- 1:length(y)

##24 high frequency lags of x included
mr <- midas_r(y ~ trend + fmls(x, 23, 12, nealmon), start = list(x = rep(0, 3)))

plot_midas_coef(mr)
```

---

```
plot_midas_coef.midas_nlpr
Plot MIDAS coefficients
```

---

**Description**

Plots MIDAS coefficients of a MIDAS regression for a selected term.

**Usage**

```
## S3 method for class 'midas_nlpr'
plot_midas_coef(
  x,
  term_name = NULL,
  title = NULL,
  compare = NULL,
  normalize = FALSE,
  ...
)
```

**Arguments**

x	midas_r object
term_name	the term name for which the coefficients are plotted. Default is NULL, which selects the first MIDAS term
title	the title string of the graph. The default is NULL for the default title.
compare	the parameters for weight function to compare with the model, default is NULL
normalize	logical, if FALSE use the weight from the model, if TRUE, set the normalization coefficient of the weight function to 1.
...	not used

**Details**

Plots MIDAS coefficients of a selected MIDAS regression term together with corresponding MIDAS coefficients and their confidence intervals of unrestricted MIDAS regression

**Value**

a data frame with restricted MIDAS coefficients, unrestricted MIDAS coefficients and lower and upper confidence interval limits. The data frame is returned invisibly.

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

---

plot\_sp

---

*Plot non-parametric part of the single index MIDAS regression*

---

**Description**

Plot non-parametric part of the single index MIDAS regression of unrestricted MIDAS regression

**Usage**

```
plot_sp(x, term_name, title = NULL, compare = NULL, ...)
```

**Arguments**

x	midas_r object
term_name	the term name for which the coefficients are plotted. Default is NULL, which selects the first MIDAS term
title	the title string of the graph. The default is NULL for the default title.
compare	the parameters for weight function to compare with the model, default is NULL
...	not used

**Value**

a data frame with restricted MIDAS coefficients, unrestricted MIDAS coefficients and lower and upper confidence interval limits. The data frame is returned invisibly.

**Author(s)**

predict.midas\_nlpr      *Predict method for non-linear parametric MIDAS regression fit*

---

**Description**

Predicted values based on midas\_nlpr object.

**Usage**

```
## S3 method for class 'midas_nlpr'
predict(object, newdata, na.action = na.omit, ...)
```

**Arguments**

object	<a href="#">midas_nlpr</a> object
newdata	a named list containing data for mixed frequencies. If omitted, the in-sample values are used.
na.action	function determining what should be done with missing values in newdata. The most likely cause of missing values is the insufficient data for the lagged variables. The default is to omit such missing values.
...	additional arguments, not used

**Details**

predict.midas\_nlpr produces predicted values, obtained by evaluating regression function in the frame newdata. This means that the appropriate model matrix is constructed using only the data in newdata. This makes this function not very convenient for forecasting purposes. If you want to supply the new data for forecasting horizon only use the function [forecast.midas\\_r](#). Also this function produces only static predictions, if you want dynamic forecasts use the [forecast.midas\\_r](#).

**Value**

a vector of predicted values

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

---

predict.midas_r	<i>Predict method for MIDAS regression fit</i>
-----------------	--

---

**Description**

Predicted values based on midas\_r object.

**Usage**

```
## S3 method for class 'midas_r'
predict(object, newdata, na.action = na.omit, ...)
```

**Arguments**

object	<a href="#">midas_r</a> object
newdata	a named list containing data for mixed frequencies. If omitted, the in-sample values are used.
na.action	function determining what should be done with missing values in newdata. The most likely cause of missing values is the insufficient data for the lagged variables. The default is to omit such missing values.
...	additional arguments, not used

**Details**

predict.midas\_r produces predicted values, obtained by evaluating regression function in the frame newdata. This means that the appropriate model matrix is constructed using only the data in newdata. This makes this function not very convenient for forecasting purposes. If you want to supply the new data for forecasting horizon only use the function [forecast.midas\\_r](#). Also this function produces only static predictions, if you want dynamic forecasts use the [forecast.midas\\_r](#).

**Value**

a vector of predicted values

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

**Examples**

```
data("USrealgdp")
data("USunempr")

y <- diff(log(USrealgdp))
x <- window(diff(USunempr), start = 1949)

##24 high frequency lags of x included
mr <- midas_r(y ~ fmls(x, 23, 12, nealmon), start = list(x = rep(0, 3)))

##Declining unemployment
xn <- rnorm(2 * 12, -0.1, 0.1)

##Only one predicted value, historical values discarded
predict(mr, list(x = xn))

##Historical values taken into account
forecast(mr, list(x = xn))
```

---

predict.midas\_sp

*Predict method for semi-parametric MIDAS regression fit*

---

**Description**

Predicted values based on midas\_sp object.

**Usage**

```
## S3 method for class 'midas_sp'
predict(object, newdata, na.action = na.omit, ...)
```

**Arguments**

object	midas_nlpr object
newdata	a named list containing data for mixed frequencies. If omitted, the in-sample values are used.
na.action	function determining what should be done with missing values in newdata. The most likely cause of missing values is the insufficient data for the lagged variables. The default is to omit such missing values.
...	additional arguments, not used

**Details**

predict.midas\_sp produces predicted values, obtained by evaluating regression function in the frame newdata. This means that the appropriate model matrix is constructed using only the data in newdata. This makes this function not very convenient for forecasting purposes. If you want to supply the new data for forecasting horizon only use the function [forecast.midas\\_r](#). Also this function produces only static predictions, if you want dynamic forecasts use the [forecast.midas\\_r](#).

**Value**

a vector of predicted values

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys-Balevičius

---

prep\_hAh

*Calculate data for [hAh\\_test](#) and [hAhr\\_test](#)*

---

**Description**

Workhorse function for calculating necessary matrices for [hAh\\_test](#) and [hAhr\\_test](#). Takes the same parameters as [hAh\\_test](#)

**Usage**

```
prep_hAh(x)
```

**Arguments**

x                    midas\_r object

**Value**

a list with necessary matrices

**Author(s)**

Virmantas Kvedaras, Vaidotas Zemlys

**See Also**

[hAh\\_test](#), [hAhr\\_test](#)

---

 rvsp500

*Realized volatility of S&P500 index*

---

**Description**

Realized volatility of S&P500(Live) index of the period 2000 01 03 - 2013 11 22

**Format**

A data.frame object with two columns. First column contains date id, and the second the realized volatility for S&P500 index.

**Source**

No longer available. Read the statement here: <https://oxford-man.ox.ac.uk/research/realized-library/>

**References**

Heber, Gerd and Lunde, Asger, and Shephard, Neil and Sheppard, Kevin *Oxford-Man Institute's realized library*, Oxford-Man Institute, University of Oxford (2009)

**Examples**

```
## Do not run:
## The original data contained the file OxfordManRealizedVolatilityIndices.csv.
## The code below reproduces the dataset.

## rvi <- read.csv("OxfordManRealizedVolatilityIndices.csv",check.names=FALSE,skip=2)
## ii <- which(rvi$DateID=="20131112")
## rvsp500 <- na.omit(rvi[1:ii,c("DataID","SPX2.rv")])
```

---

 select\_and\_forecast

*Create table for different forecast horizons*

---

**Description**

Creates tables for different forecast horizons and table for combined forecasts

**Usage**

```
select_and_forecast(
  formula,
  data,
  from,
  to,
  insample,
```

```

    outsample,
    weights,
    wstart,
    start = NULL,
    IC = "AIC",
    seltype = c("restricted", "unrestricted"),
    test = "hAh_test",
    ftype = c("fixed", "recursive", "rolling"),
    measures = c("MSE", "MAPE", "MASE"),
    fweights = c("EW", "BICW", "MSFE", "DMSFE"),
    ...
)

```

### Arguments

formula	initial formula for the
data	list of data
from	a named list of starts of lags from where to fit. Denotes the horizon
to	a named list for lag selections
insample	the low frequency indexes for in-sample data
outsample	the low frequency indexes for out-of-sample data
weights	names of weight function candidates
wstart	starting values for weight functions
start	other starting values
IC	name of information criteria to choose model from
seltype	argument to modsel, "restricted" for model selection based on information criteria of restricted MIDAS model, "unrestricted" for model selection based on unrestricted (U-MIDAS) model.
test	argument to modsel
ftype	which type of forecast to use.
measures	the names of goodness of fit measures
fweights	names of weighting schemes
...	additional arguments for optimisation method, see <a href="#">midas_r</a>

### Details

Divide data into in-sample and out-of-sample. Fit different forecasting horizons for in-sample data. Calculate accuracy measures for individual and average forecasts.

### Value

a list containing forecasts, tables of accuracy measures and the list with selected models

### Author(s)

Virmantas Kvedaras, Vaidotas Zemlys

**Examples**

```

### Sets a seed for RNG ###
set.seed(1001)
## Number of low-frequency observations
n<-250
## Linear trend and higher-frequency explanatory variables (e.g. quarterly and monthly)
trend<-c(1:n)
x<-rnorm(4*n)
z<-rnorm(12*n)
## Exponential Almon polynomial constraint-consistent coefficients
fn.x <- nealmon(p=c(1,-0.5),d=8)
fn.z <- nealmon(p=c(2,0.5,-0.1),d=17)
## Simulated low-frequency series (e.g. yearly)
y<-2+0.1*trend+m1s(x,0:7,4)%*%fn.x+m1s(z,0:16,12)%*%fn.z+rnorm(n)
##Do not run
## cbfc<-select_and_forecast(y~trend+m1s(x,0,4)+m1s(z,0,12),
## from=list(x=c(4,8,12),z=c(12,24,36)),
## to=list(x=rbind(c(14,19),c(18,23),c(22,27)),z=rbind(c(22,27),c(34,39),c(46,51))),
## insample=1:200,outsample=201:250,
## weights=list(x=c("nealmon","almonp"),z=c("nealmon","almonp")),
## wstart=list(nealmon=rep(1,3),almonp=rep(1,3)),
## IC="AIC",
## seltype="restricted",
## ftype="fixed",
## measures=c("MSE","MAPE","MASE"),
## fweights=c("EW","BICW","MSFE","DMSFE")
## )

```

---

simulate.midas\_r

*Simulate MIDAS regression response*

---

**Description**

Simulates one or more responses from the distribution corresponding to a fitted MIDAS regression object.

**Usage**

```

## S3 method for class 'midas_r'
simulate(
  object,
  nsim = 999,
  seed = NULL,
  future = TRUE,
  newdata = NULL,
  insample = NULL,
  method = c("static", "dynamic"),
  innov = NULL,

```

```

    show_progress = TRUE,
    ...
  )

```

### Arguments

object	midas_r object
nsim	number of simulations
seed	either NULL or an integer that will be used in a call to set.seed before simulating the time series. The default, NULL will not change the random generator state.
future	logical, if TRUE forecasts are simulated, if FALSE in-sample simulation is performed.
newdata	a named list containing future values of mixed frequency regressors. The default is NULL, meaning that only in-sample data is used.
insample	a list containing the historic mixed frequency data
method	the simulation method, if "static" in-sample values for dependent variable are used in autoregressive MIDAS model, if "dynamic" the dependent variable values are calculated step-by-step from the initial in-sample values.
innov	a matrix containing the simulated innovations. The default is NULL, meaning, that innovations are simulated from model residuals.
show_progress	logical, TRUE to show progress bar, FALSE for silent evaluation
...	not used currently

### Details

Only the regression innovations are simulated, it is assumed that the predictor variables and coefficients are fixed. The innovation distribution is simulated via bootstrap.

### Value

a matrix of simulated responses. Each row contains a simulated response.

### Author(s)

Virmantas Kvedaras, Vaidotas Zemlys

### Examples

```

data("USrealgdp")
data("USunempr")

y <- diff(log(USrealgdp))
x <- window(diff(USunempr), start = 1949)
trend <- 1:length(y)

##24 high frequency lags of x included
mr <- midas_r(y ~ trend + fmls(x, 23, 12, nealmon), start = list(x = rep(0, 3)))

```

```
simulate(mr, nsim=10, future=FALSE)

##Forecast horizon
h <- 3
##Declining unemployment
xn <- rep(-0.1, 12*3)
##New trend values
trendn <- length(y) + 1:h

simulate(mr, nsim = 10, future = TRUE, newdata = list(trend = trendn, x = xn))
```

---

split\_data

*Split mixed frequency data into in-sample and out-of-sample*

---

## Description

Splits mixed frequency data into in-sample and out-of-sample datasets given the indexes of the low frequency data

## Usage

```
split_data(data, insample, outsample)
```

## Arguments

data	a list containing mixed frequency data
insample	the low frequency indexes for in-sample data
outsample	the low frequency indexes for out-of-sample data

## Details

It is assumed that data is a list containing mixed frequency data. Then given the indexes of the low frequency data the function splits the data into two subsets.

## Value

a list with elements `indata` and `outdata` containing respectively in-sample and out-of-sample data sets

## Author(s)

Virmantas Kvedaras, Vaidotas Zemlys

**Examples**

```
#Monthly data
x <- 1:24
#Quarterly data
z <- 1:8
#Yearly data
y <- 1:2
split_data(list(y=y,x=x,z=z),insample=1,outsample=2)
```

---

update_weights	<i>Updates weights in MIDAS regression formula</i>
----------------	--

---

**Description**

Updates weights in a expression with MIDAS term

**Usage**

```
update_weights(expr, tb)
```

**Arguments**

expr	expression with MIDAS term
tb	a named list with redefined weights

**Details**

For a MIDAS term `fm1s(x, 6, 1, nealmon)` change weight `nealmon` to another weight.

**Value**

an expression with changed weights

**Author(s)**

Vaidotas Zemlys

**Examples**

```
update_weights(y~trend+m1s(x,0:7,4,nealmon)+m1s(z,0:16,12,nealmon),list(x = "nbeta", z = ""))
```

---

UScpiqs	<i>US quarterly seasonally adjusted consumer price index</i>
---------	--

---

**Description**

US quarterly CPI from 1960Q1 to 2017Q3s. Seasonally adjusted, Index 2015=1

**Format**

A `data.frame` object.

**Source**

FRED

---

USEffrw	<i>US weekly effective federal funds rate.</i>
---------	--

---

**Description**

US weekly effective federal funds rate from 1954-07-07 to 2017-12-13

**Format**

A `data.frame` object.

**Source**

FRED

---

USpayems	<i>United States total employment non-farms payroll, monthly, seasonally adjusted.</i>
----------	--

---

**Description**

United States total employment non-farms payroll, monthly, seasonally adjusted. Retrieved from FRED, symbol "PAYEMS" at 2014-04-25.

**Format**

A `ts` object.

**Source**

FRED, Federal Reserve Economic Data, from the Federal Reserve Bank of St. Louis

**Examples**

```
## Do not run:
## library(quantmod)
## USpayems <- ts(getSymbols("PAYEMS",src="FRED",auto.assign=FALSE),start=c(1939,1),frequency=12)
```

---

USqgdp	<i>United States gross domestic product, quarterly, seasonally adjusted annual rate.</i>
--------	--

---

**Description**

United States gross domestic product, quarterly, seasonally adjusted annual rate. Retrieved from FRED, symbol "GDP" at 2014-04-25.

**Format**

A `ts` object.

**Source**

FRED, Federal Reserve Economic Data, from the Federal Reserve Bank of St. Louis

**Examples**

```
## Do not run:
## library(quantmod)
## USqgdp <- ts(getSymbols("GDP",src="FRED",auto.assign=FALSE),start=c(1947,1),frequency=4)
```

---

USrealgdp	<i>US annual gross domestic product in billions of chained 2005 dollars</i>
-----------	---

---

**Description**

The annual gross domestic product in billions of chained 2005 dollars for US from 1948 to 2011. This data is kept for historical purposes, newer data is in 2012 chained dollars.

**Format**

A `ts` object.

**Source**

U.S. Department of Commerce, Bureau of Economic Analysis

---

USunempr	<i>US monthly unemployment rate</i>
----------	-------------------------------------

---

**Description**

The monthly unemployment rate for United States from 1948 to 2011.

**Format**

A `ts` object.

**Source**

**FRED**

---

weights_table	<i>Create a weight function selection table for MIDAS regression model</i>
---------------	--

---

**Description**

Creates a weight function selection table for MIDAS regression model with given information criteria and weight functions.

**Usage**

```
weights_table(
  formula,
  data,
  start = NULL,
  IC = c("AIC", "BIC"),
  test = c("hAh_test"),
  Ofunction = "optim",
  weight_gradients = NULL,
  ...
)
```

**Arguments**

formula	the formula for MIDAS regression, the lag selection is performed for the last MIDAS lag term in the formula
data	a list containing data with mixed frequencies
start	the starting values for optimisation
IC	the information criteria which to compute
test	the names of statistical tests to perform on restricted model, p-values are reported in the columns of model selection table

Ofunction        see [midasr](#)  
 weight\_gradients  
                   see [midas\\_r](#)  
 ...               additional parameters to optimisation function, see [midas\\_r](#)

### Details

This function estimates models sequentially increasing the midas lag from `kmin` to `kmax` of the last term of the given formula

### Value

a `midas_r_ic_table` object which is the list with the following elements:

<code>table</code>	the table where each row contains calculated information criteria for both restricted and unrestricted MIDAS regression model with given lag structure
<code>candlist</code>	the list containing fitted models
<code>IC</code>	the argument <code>IC</code>

### Author(s)

Virmantas Kvedaras, Vaidotas Zemlys

### Examples

```
data("USunempr")
data("USrealgdp")
y <- diff(log(USrealgdp))
x <- window(diff(USunempr),start=1949)
trend <- 1:length(y)
mwr <- weights_table(y~trend+fmls(x,12,12,nealmon),
                     start=list(x=list(nealmon=rep(0,3),
                                         nbeta=c(1,1,1,0))))
```
