

Package ‘miRNAtap’

April 10, 2015

Type Package

Title miRNAtap: microRNA Targets - Aggregated Predictions

Version 1.0.0

Date 2014-10-01

Author Maciej Pajak, T. Ian Simpson

Maintainer Maciej Pajak <m.pajak@sms.ed.ac.uk>

Description The package facilitates implementation of workflows requiring miRNA predictions, it allows to integrate ranked miRNA target predictions from multiple sources available online and aggregate them with various methods which improves quality of predictions above any of the single sources. Currently predictions are available for *Homo sapiens*, *Mus musculus* and *Rattus norvegicus* (the last one through homology translation).

License GPL-2

Depends R (>= 3.0.0), AnnotationDbi

Imports DBI, RSQLite, stringr, sqldf, plyr, methods

Suggests topGO, org.Hs.eg.db, miRNAtap.db

biocViews Software, Classification, Microarray, Sequencing, miRNA

Roxygen list(wrap = FALSE)

R topics documented:

aggregateRanks	2
getPredictedTargets	2
getTargetsFromSource	4
MirnaDb-class	5
miRNAtap	6
translate	7

Index

aggregateRanks	<i>Auxiliary targetPredictor functions</i>
----------------	--

Description

Auxiliary targetPredictor functions

Usage

```
aggregateRanks(ranks, n_valid_srcs, min_src, method = "min", promote = TRUE)
```

Arguments

ranks	data.frame with ordered scored
n_valid_srcs	number of valid sources in the dataset
min_src	minimum acceptable number fo sources
method	'min', 'max', or 'geom'
promote	add weights to improve accuracy of the method, default TRUE

Details

This function performs aggregation phase of target prediction for [getPredictedTargets](#) function

Value

data.frame object with aggregate ranks

Author(s)

Maciej Pajak <m.pajak@sms.ed.ac.uk>

getPredictedTargets	<i>Get aggregated ordered list of predicted targets for miRNA</i>
---------------------	---

Description

Get aggregated ordered list of predicted targets for miRNA

Usage

```
getPredictedTargets(mirna, sources = c("pictar", "diana",
"targetscan", "miranda"), species = "mmu", min_src = 2,
method = "min", promote = TRUE, ...)
```

Arguments

mirna	miRNA in a standard format
sources	a list of sources to use for aggregation, default c('piptar','diana','targetscan','miranda')
species	species in a standard three-letter acronym, 'mmu' and 'hsa' available as direct targets, 'rno' as homology translations, default 'mmu'
min_src	minimum number of sources required for a target to be considered, default 2
method	method of aggregation - choose from 'min', 'max', 'geom', default 'min' is a minimum of ranks, 'max' is a maximum of ranks, and 'geom' is based on geometric mean of the ranks, it proves to be the most accurate.
promote	add weights to improve accuracy of the method, default TRUE
...	any optional arguments

Details

This method performs aggregation of target lists from multiple sources. Aggregated list is more accurate than any list from a single source. Multiple aggregation methods are available. Direct target data from four sources for Human and Mouse is supplied through `miRNAtap.db` package, for Rat targets are derived through homology translations whenever direct ones are not available.

Value

a data.frame object where row names are entrez IDs of target genes, ranks from individual sources and aggregated rank are shown in columns

Author(s)

Maciej Pajak <m.pajak@sms.ed.ac.uk>

Examples

```
targets <- getPredictedTargets(let-7a, species=mmu)
head(targets) #top of the list with minimum aggregation
targets2 <- getPredictedTargets(let-7a, species=mmu, method=geom)
head(targets2) #top of the list with geometric mean aggregation
```

`getTargetsFromSource` *Get target list from a single source*

Description

Get target list from a single source

Usage

```
getTargetsFromSource(mirna, species = "mmu", source = "diana")
```

Arguments

mirna	miRNA in a standard format
source	a list of sources to use for aggregation, default 'diana'
species	species in a standard three-letter acronym, default 'mmu'

Details

This function queries precompiled annotation SQLite database which contains miRNA - target gene associations with their respective scores.

Value

a data.frame object with entrez IDs of target genes and their scores

Author(s)

Maciej Pajak <m.pajak@sms.ed.ac.uk>

Examples

```
targets <- getTargetsFromSource(let-7a, species=hsa, source=targetscan)
head(targets) #top of the list for TargetScan only
```

MirnaDb-class

Database class

Description

object of MirnaDb class holds the sqlite database connection, and extends AnnotationDb class from AnnotationDbi package. columns, keys, keytypes and select methods allow access to database tables and retrieval of miRNA target information.

select is the most important method, allows querying the database for predictions from a specific source and species for a given miRNA

Usage

```
columns(x)
keytypes(x)
keys(x, keytype, ...)
select(x, keys, columns, keytype, ...)

## S4 method for signature MirnaDb
columns(x)

## S4 method for signature MirnaDb
keytypes(x)

## S4 method for signature MirnaDb
keys(x, keytype, ...)

## S4 method for signature MirnaDb
select(x, keys, columns, keytype, ...)
```

Arguments

- x the MirnaDb object
- keytype the keytype that matches the keys used; the table in which the search should be performed.
- keys the key to select records for from the database - miRNA name; all possible keys (miRNAs) are returned by using the keys method.

columns	in this case same as keytype, the table in which the search should be performed, this value specifies the source of predictions as well as species; as with keys, all possible columns are returned by using the <code>columns</code> method.
...	any optional arguments

Value

string vectors, for select a data.frame with target genes and scores

Author(s)

Maciej Pajak <m.pajak@sms.ed.ac.uk>

Examples

```
#first load the annotations
require(miRNAtap.db)
#see all available tables
keytypes(miRNAtap.db)
```

miRNAtap

miRNAtap: microRNA Targets - Aggregated Predictions.

Description

miRNAtap: microRNA Targets - Aggregated Predictions.

Details

It is a package with tools to facilitate implementation of workflows requiring miRNA prediction through access to multiple prediction results (DIANA, Targetscan, PicTar and Miranda) and their aggregation. Three aggregation methods are available: minimum, maximum and geometric mean, additional parameters provide further tuning of the results. Predictions are available for Homo sapiens, Mus musculus and Rattus norvegicus (the last one through homology translation).

Author(s)

Maciej Pajak <m.pajak@sms.ed.ac.uk>, T. Ian Simpson

Examples

```
#direct targets in mouse aggregated from all sources:
targets_mouse <- getPredictedTargets(let-7a,species=mmu, method=geom)
#homology-translated targets in rat aggregated from all sources
targets_rat <- getPredictedTargets(let-7a,species=mmu, method=geom)
```

translate*Homology translation for miRNAtap*

Description

Homology translation for miRNAtap

Usage

```
translate(entrezes, from = "mmu", to = "rno", ...)
```

Arguments

entrezes	data.frame with entrez Gene IDs and their scores
from	origin species
to	target species
...	any optional arguments

Details

Translates gene ID using homology information from homologene.

Value

data.frame object with orthologous genes' entrez IDs and corresponding scores

Author(s)

Maciej Pajak <m.pajak@sms.ed.ac.uk>

Examples

```
mouse_genes <- data.frame(GeneID =
  c("15364", "56520", "57781", "58180", "18035", "239857"))
translate(mouse_genes, from=mmu, to=rno)
```
