Package 'ramwas'

October 16, 2019

Type Package

Title Fast Methylome-Wide Association Study Pipeline for Enrichment Platforms

Version 1.8.0

Date 2019-02-18

Maintainer Andrey A Shabalin <andrey.shabalin@gmail.com>

Description A complete toolset for methylome-wide association studies (MWAS). It is specifically designed for data from enrichment based methylation assays, but can be applied to other data as well. The analysis pipeline includes seven steps: (1) scanning aligned reads from BAM files, (2) calculation of quality control measures, (3) creation of methylation score (coverage) matrix, (4) principal component analysis for capturing batch effects and detection of outliers, (5) association analysis with respect to phenotypes of interest while correcting for top PCs and known covariates, (6) annotation of significant findings, and (7) multi-marker analysis (methylation risk score) using elastic net. Additionally, RaMWAS include tools for joint analysis of methlyation and genotype data. This work is published in Bioinformatics, Shabalin et al. (2018) <doi:10.1093/bioinformatics/bty069>.

Fast Methylome-wide Association Study Pipeline for Enrichment Platforms

Description

RaMWAS provides a complete toolset for methylome-wide association studies (MWAS). It is specifically designed for data from enrichment based methylation assays, but can be applied to other methylomic data as well. The analysis pipeline includes seven steps: (1) scanning aligned reads from BAM files, (2) calculation of quality control measures, (3) creation of methylation score (coverage) matrix, (4) principal component analysis for capturing batch effects and detection of outliers, (5) association analysis with respect to phenotypes of interest while correctingfor top PCs and known covariates, (6) annotation of significant findings, and (7) multi-marker analysis (methylation risk score) using elastic net.

cachedRDSload Cached Loading of RDS Files

Description

Loads an .rds file rdsfilename using readRDS and returns the loaded object. The object is also saved in a cache so that repeated calls of the function with the same filename return the same object instanteneously.

Usage

```
cachedRDSload(rdsfilename)
```

Arguments

rdsfilename Name of the RDS file.

Details

The cached object is stored in a private package environment.

Value

Returns the object loaded with readRDS from rdsfilename at this or a previous call of the function.

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

Examples

Change filename to hg19 CpGset

```
filename = system.file("extdata", "qc_sample.rds", package = "ramwas")
time1 = system.time( {obj1 = cachedRDSload(filename)} )
time2 = system.time( {obj1 = cachedRDSload(filename)} )
cat("First loading time:",time1[3],"seconds","\n")
cat("Second loading time:",time2[3],"seconds","\n")
```

findBestNpvs Quickly Find N Smallest P-values in a Long Vector

Description

Finding top, say, 100 p-values out of millions can be slow. This function does it much faster than the usual application of order(pv)[1:N].

Usage

findBestNpvs(pv, n)

Arguments

pv	Vector of p-values.
n	Number of best p-values to select.

Details

The function is a faster analog of sort(order(pv)[1:N])

Value

Return a vector of positions of the smallest N p-values in pv.

get

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

See Also

See order.

Examples

```
pv = runif(1000)^10
n = 100
# Faster version
topSites1 = findBestNpvs(pv, n)
# Slow alternative
topSites2 = sort(order(pv)[1:n])
# The results must match
stopifnot(all( topSites1 == topSites2 ))
```

get	Functions for Access to Data, MWAS Results, and Location Informa-
	tion

Description

Functions for access to data, MWAS results, and location information.

Function getLocations obtains the location information for all variables (CpGs).

Function getMWASandLocations obtains both MWAS results and location information in a single data frame.

Functions getDataByLocation and getMWASrange return the data (coverage) and MWAS results for the selected set of variables (CpGs).

Usage

```
getLocations(x)
getMWAS(x)
getMWASandLocations(x)
getMWASrange(x, chr, start, end)
getDataByLocation(x, chr, start, end)
```

Arguments

х

Name of directory or list of RaMWAS parameters as described in the "RW6_param.Rmd" vignette.

Try: vignette("RW6_param", "ramwas").

If a directory name is provided, it must point to

• Data (coverage) directory (parameter dircoveragenorm) for getDataByLocation and getLocations

	 MWAS directory (parameter dirmwas) for getMWAS, getMWASandLocations, and getMWASrange
chr	Chromosome name or number.
start	Start position of the genomic region of interest.
end	End position of the genomic region of interest.

Details

The functions return the MWAS results and/or locations.

Value

Function getLocations returns a data frame with

chr	Chromosome
start	Start position
end	End position
Function getMWAS returns a data frame with	
cor	coverage - phenotype correlation
cor t.test	coverage - phenotype correlation t-statistic

If the outcome variable was categorical, columns cor and t.test are replaced with ${\tt R}.$ squared and ${\tt F-test}.$

 $\label{eq:stars} Functions \ \texttt{getMWAS} and \texttt{Locations} \ and \ \texttt{getMWAS} range \ \texttt{return} \ a \ data \ frame \ with \ \texttt{elements} \ of \ \texttt{output} \ of \ \texttt{both} \ \texttt{getLocations} \ and \ \texttt{getMWAS}$

Function getDataByLocation returns a list with

locations	Chromosomal location information for located variables
matrix	Data (coverage) matrix for the selected locations

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

See Also

See vignettes: browseVignettes("ramwas").

Examples

```
## Not run:
# Extract locations using parameter vector
getLocations(param)
# Extract locations using directory name
getLocations("/data/myMWAS")
```

Extract MWAS using parameter vector

getCpGset

```
getMWAS(param)
# Extract MWAS using directory name
getMWAS("/data/myMWAS")
# Extract MWAS using parameter vector
getMWASandLocations(param)
# Extract MWAS using directory name
getMWASandLocations("/data/myMWAS")
# Extract MWAS for a region
getMWASrange(param, 1, 123321, 223321)
# Chromosome can be character
getMWASrange(param, "chr1", 123321, 223321)
# Extract data for a region
getDataByLocation(param, 1, 123321, 223321)
# Chromosome can be character
getDataByLocation(param, "chr1", 123321, 223321)
## End(Not run)
```

getCpGset

Construct CpG set for a Reference Genome

Description

Finds all CpGs in a reference genome.

Usage

```
getCpGsetCG(genome)
getCpGsetALL(genome)
```

Arguments

genome

A BSgenome object or a character vector with genome sequences.

Details

The getCpGsetCG function searches for all CG pairs in the genome. The getCpGsetALL function also works for genomes with injected SNPs.

Value

Returns a list with CpG coordinates for each genome sequence.

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

Examples

Using a BSGenome input

```
library(BSgenome.Ecoli.NCBI.20080805)
cpgset = getCpGsetCG(BSgenome.Ecoli.NCBI.20080805)
```

```
print("First 10 CpGs in NC_008253:")
print(cpgset$NC_008253[1:10])
```

Using a character vector input

```
genome = list(
    chr1 = "AGCGTTTTCATTCTGACTGCAACGGGCYR",
    chr2 = "AAAAAACGCCTTAGTAAGTGATTTTCGYR")
cpgset1 = getCpGsetCG(genome)
cpgset2 = getCpGsetALL(genome)
```

```
print("Pure CG coordinates in the toy genome:")
print(cpgset1)
print("CG coordinates in the toy genome possible with SNPs:")
```

```
injectSNPsMAF Inject SNPs from VCF Count File into a DNA Sequence
```

Description

print(cpgset2)

Injects SNPs from a VCF count file into a DNA sequence.

Usage

```
injectSNPsMAF(gensequence, frqcount, MAF = 0.01)
```

Arguments

gensequence	A string or DNAString of the DNA sequence.
frqcount	File name of the allele count file produced by vcftools withcounts parameter. Alternatively, the file content can be provided as a character vector (see readLines).
MAF	SNPs with minor allele frequency at or above MAF are injected.

Value

Returns a string with the genome sequence with SNPs injected.

insilicoFASTQ

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

See Also

See injectSNPs for the standard analog function without MAF filtering.

Examples

```
gensequence1 = "AAAACAAAA"
frqcount = c(
    "CHROM\tPOS\tN_ALLELES\tN_CHR\t{ALLELE:COUNT}",
    "1\t6\t2\t1000\tA:400\t6:600",
    "1\t7\t2\t1000\tA:800\tC:200",
    "1\t9\t2\t1000\tA:900\t6:100")
MAF = 0.01
gensequence2 = injectSNPsMAF(gensequence1, frqcount, MAF)
### No CpGs without SNPs
show(gensequence1)
getCpGsetCG(gensequence1)
### SNPs create 1 CpG
show(gensequence2)
getCpGsetALL(gensequence2)
```

insilicoFASTQ Construct FASTQ File for In-silico Alignment Experiment

Description

Creates a FASTQ file with all fragments of fraglength bp long.

Usage

insilicoFASTQ(con, gensequence, fraglength)

Arguments

con	A connection object or a character string naming the output file.
	If the name ends with ".gz", a compressed file is created.
	An empty string can be used to output to the console.
gensequence	A string or DNAString of the DNA sequence.
fraglength	Fragment length.

Details

The function a FASTQ file with all fragments of fraglength bp long from the forward strand of the DNA sequence.

Value

Returns a list with CpG coordinates for each genome sequence.

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

Examples

```
## There are four 4 bp fragments in a 7 basepair sequence:
insilicoFASTQ(con="", gensequence = "ABCDEFG", fraglength=4)
```

isAbsolutePath Check if Path is Absolute.

Description

Check whether a path is relative or absolute.

Usage

```
isAbsolutePath(path)
```

Arguments

path Path to be tested.

Details

The function is designed to word with both Windows and Unix paths.

Value

TRUE if the path is absolute, FALSE otherwise.

Note

This function improves upon the analog function in R.utils package. For instance, "~hi" is not an absolute path.

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

See Also

See also makefullpath.

madeBED

Examples

isAbsolutePath("C:/123") # TRUE isAbsolutePath("~123") # FALSE isAbsolutePath("~/123") # TRUE isAbsolutePath("/123") # TRUE isAbsolutePath("\\123") # TRUE isAbsolutePath("asd\\123") # FALSE isAbsolutePath("a\\123") # FALSE

```
madeBED
```

Export MWAS results in BED format.

Description

Functions for exporting MWAS results in BED format files.

Function madeBED saves MWAS findings in BED format for all variables (CpGs), while madeBEDrange selects only variables on a given chromosome between given locations.

Functions madeBEDgraph and madeBEDgraphRange do the same, but create a file in BedGraph format.

Usage

```
madeBED(x, filename)
madeBEDrange(x, filename, chr, start, end)
madeBEDgraph(x, filename)
madeBEDgraphRange(x, filename, chr, start, end)
```

Arguments

x	Name of MWAS directory (parameter dirmwas) or list of RaMWAS parameters as described in the "RW6_param.Rmd" vignette. Try: vignette("RW6_param", "ramwas").
filename	Name of the BED file to create. If file exists, it's overwritten.
chr	Chromosome name or number.
start	Start position of the genomic region of interest.
end	End position of the genomic region of interest.

Details

The function returns the MWAS results with locations.

Value

Returns a data.frame with BED file content:

chrom	Chromosome
chromStart	Start position
chromEnd	End position
name	Empty name column. BED format only
score	p-value

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

See Also

See vignettes: browseVignettes("ramwas").

Examples

```
## Not run:
# Extract BED file using parameter vector
madeBED(param, "file.bed")
madeBEDrange(param, "file.bed", 1, 123321, 223321)
# Extract BED file using directory name
madeBED("/data/myMWAS", "file.bed")
madeBEDrange("/data/myMWAS", "file.bed", 1, 123321, 223321)
## End(Not run)
```

```
makefullpath
```

Combine Path and Filename into Filename with Path

Description

Combine a path with a filename into filename with path.

Usage

```
makefullpath(path, filename)
```

Arguments

path	Path, relative to which the filename is expected to be. Can be absolute, relative, or NULL.
filename	Can be just filename, include relative path, or include absolute path.

Details

Function returns filename if it includes absolute path or if path is NULL.

Value

Filename with the path included.

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

See Also

See also isAbsolutePath.

manhattan

Examples

```
makefullpath("dir1/dir2", "file.txt")
# "dir1/dir2/file.txt"
makefullpath("dir1/dir2", "dir3/file.txt")
# "dir1/dir2/dir3/file.txt"
# Path is ignored if the filename already includes absolute path
makefullpath("dir1/dir2", "/file.txt")
# "/file.txt"
makefullpath("dir1/dir2", "C:/file.txt")
# "C:/file.txt"
```

manhattan

Fast Manhattan plot for Large Number of P-values

Description

The function manPlotFast creates a Manhattan plot. The function manPlotPrepare extracts necessary information from a vector of p-values sufficient for creating a Manhattan plot. It optimized to work quickly even for tens of millions of p-values.

Usage

```
manPlotPrepare(
    pvalues,
    chr,
    pos,
    ismlog10 = FALSE,
    chrmargins = 5e6)
manPlotFast(
    man,
    ylim = NULL,
    colorSet = c('steelblue4',"#2C82D1","#4CB2D1"),
    yaxmax = NULL,
    lwd = 3,
    axistep = 2,
    cex = 1)
```

Arguments

pvalues	Vector of p-values. As is (if ismlog10 = FALSE) or minus log10 transformed (if ismlog10 = TRUE).
chr, pos	Vectors indicating the chromosomes and genomic positions (in basepairs) for each p-value in pvalues.
ismlog10	Specifies whether the provides p-values (pvalues parameter) are minus log10 transformed (-log10(pv))

chrmargins	The plot margins at the ends of chromosomes (in basepairs).
man	Object returned by manPlotPrepare.
ylim	Numeric vectors of length 2, giving the y coordinate range. Exactly as in Plot- ting Parameters.
colorSet	Colors of points, rotating over chromosomes. Points for first chromosome have color colorSet[1], next colorSet[2], etc. Once the colors are exhausted, the colors are reused from the beginning.
yaxmax	Maximum reach of the y axis.
lwd	The line width. As in Graphics Parameters.
axistep	Distance between axis label ticks for y axis.
cex	The size of Manhattan plot points. As in Graphics Parameters.

Details

The function manPlotFast creates Manhattan plot. It requires the use of the function manPlotPrepare which extracts the necessary information from a vector of p-values sufficient for creating Manhattan plot. The resulting object is many times smaller than the vector of p-values.

Value

This function manPlotPrepare returns an object with information for creating Manhattan plot.

Note

The plot has no title. To add a title use title.

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

See Also

See vignettes: browseVignettes("ramwas").

Examples

```
# Simulate data (9 chromosomes, million tests each)
chr = rep(paste0('chr',1:9), each = 1e6)
pos = rep(1:1e6, 9)
pv = runif(9e6)^1.1
```

```
# Extract the Manhattan plot info
man = manPlotPrepare(pv, chr, pos, chrmargins = 1000)
```

```
# Create Manhattan plot
manPlotFast(man)
title("Manhattan plot")
```

```
# Size of p-values before extraction of Manhattan plot info
object.size(list(pv, chr, pos))
```

mat2cols

```
# Size of the Manhattan plot info object
object.size(man)
```

mat2cols

Split a Matrix into Column Vectors

Description

Internal function for splitting a matrix into column vectors.

Usage

mat2cols(x)

Arguments

х

A matrix.

Value

List of matrix columns.

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

See Also

See vignettes: browseVignettes("ramwas").

Examples

```
# Sample data
data = matrix(1:12, nrow = 3)
# Split it
mat2cols(data)
```

orthonormalizeCovariates

Orthonormalize Covariates

Description

Takes a matrix of data frame with covariates, adds a constant covariate (optional), and orthonormalizes the set.

Usage

```
orthonormalizeCovariates(cvrt, modelhasconstant)
```

Arguments

cvrt A matrix or data frame with covariates (one column per covariate). modelhasconstant

Set to TRUE to add a constant covariate into the set before normalization.

Details

Factor variables are split into dummy variables before orthonormalization. The operation is performed via QR decomposition (qr).

Value

Returns a matrix with orthogonal columns with unit length, whose columns spans the same space as the covariates plus a constant (if modelhasconstant is TRUE).

Note

This function is used in several parts of the pipeline.

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

Examples

```
# Sample matrix of covariates
covariates = data.frame(a = 1:12, b = 12:1)
# Orthonormalizing Covariates
cvrtqr = orthonormalizeCovariates(covariates, modelhasconstant = TRUE)
# Checking the results (round to ignore rounding errors)
print( round(crossprod(cvrtqr),15) )
# Stop if not orthonormal
stopifnot(all.equal( crossprod(cvrtqr), diag(ncol(cvrtqr)) ))
# Example with a factor variable
groups = data.frame(gr = c("a","a","a","b","b","b","c","c","c","c"))
orthonormalizeCovariates(groups)
```

parameterDump Save Parameters in a Text File

Description

Saves parameters in a text file, prioritizing those listed in toplines.

Usage

```
parameterDump(dir, param, toplines = NULL)
```

parameterDump

Arguments

dir	Directory to save the parameters to. The file is named "UsedSettings.txt".
param	A list with RaMWAS parameters. Or any list in general. For detailed description of all available parameters run: browseVignettes("ramwas").
toplines	Names of the elements in param to save first (top of the file).

Details

This function is used internally by multiple RaMWAS functions to record parameters used to run the analysis.

Value

The function creates a file and returns nothing.

Note

This function is not intended to be run by the user.

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

See Also

See vignettes: browseVignettes("ramwas")

Examples

```
param = ramwasParameters(
    number = 123123,
    integer = 312L,
    textline = "Hi there",
    characterVector = c("Hi","Hi again","Bye"),
    dataframe = data.frame(a = 1:12, b = 12:1)
    )
thedir = tempdir()
parameterDump(thedir, param, c("integer","characterVector"))
cat( readLines( paste0(thedir,"/UsedSettings.txt") ), sep = "\n")
file.remove( paste0(thedir,"/UsedSettings.txt") )
```

parameterPreprocess Preprocess Pipeline Parameter List.

Description

Fill in missing parameters with default values, read supporting data files, make relative directory path parameters absolute.

Usage

parameterPreprocess(param)

Arguments

param

List with RaMWAS parameters. For detailed description of all available parameters run: browseVignettes("ramwas").

Details

A number of common preprocessing steps necessary for parameters of multiple pipeline parts are combined in this function. The actions include

- Fill in default values for all missing parameters.
- Set bamnames parameter to the content filebamlist file (if bamnames was not set).
- Set *bam2sample* parameter to processed content of *filebam2sample* file (if *bam2sample* was not set).
- Set covariates parameter to the data frame from filecovariates file (if covariates was not set).
- Check parameters for consistency, i.e. that *modelcovariates* include only names of columns in *covariates*.
- Check that files filecpgset and filenoncpgset exist if the parameters are set.

Value

Returns preprocessed list of parameters.

Note

This function is not intended to be run by the user.

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

See Also

See vignettes: browseVignettes("ramwas").

parametersFromFile

Examples

param = ramwasParameters(dirproject = ".") param2 = parameterPreprocess(param) print(param2)

parametersFromFile Scan Parameters From a R Code File

Description

The pipeline parameters can be stored in a simple file, formatted as R code. The parametersFromFile function transforms them into a parameter list used by RaMWAS steps.

Usage

```
parametersFromFile(.parameterfile)
```

Arguments

.parameterfile Name of the file with the parameters set as R variables. See the example below.

Details

Variables with names starting with period (.) are ignored.

Value

Returns the list with all the variables set in the file.

Note

The file .parameterfile is executed as R code, so use only trusted parameter files.

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

See Also

See vignettes: browseVignettes("ramwas").

pipeline

Examples

```
filename = tempfile()
# Create a file with lines
# dirproject = "."
# modelcovariates = c("Age","Sex")
writeLines(
    con = filename,
    text = c(
       "dirproject = \".\"",
       "modelcovariates = c(\"Age\",\"Sex\")")
    )
# Scan the file into a list
param = parametersFromFile(filename)
# Show the list
print(param)
file.remove(filename)
```

pipeline

RaMWAS: High Level Pipeline Functions

Description

These functions provide a simple way to run all steps of RaMWAS pipeline.

Usage

```
ramwas1scanBams(param)
pipelineProcessBam(bamname, param)
ramwas2collectqc(param)
ramwas3normalizedCoverage(param)
ramwas4PCA(param)
ramwas5MWAS(param)
ramwas5AWAS(param)
ramwas7ArunMWASes(param)
ramwas7BrunElasticNet(param)
ramwas7CplotByNCpGs(param)
ramwas7riskScoreCV(param)
ramwasSNPs(param)
```

Arguments

param	List with RaMWAS parameters.
	For detailed description of all available parameters run:
	browseVignettes("ramwas").
bamname	Name of the BAM file to process. Can be absolute or relative to dirbam parameter (in param list).

pipeline

Details

See vignettes for details: browseVignettes("ramwas").

Value

Function pipelineProcessBam returns "OK. <bamname>" if no error occurred. Otherwise, returns text with error. Other functions return nothing.

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

## End(Not run)
```

plotCV

Description

The function plotPrediction plots cross validation predictions of a phenotype against true values of the phenotype with multiple summary stats in the title.

The function plotCVcors plots the predictive power (correlations) across predictions using various numbers of markers.

The function plotROC plots an ROC (Receiver operating characteristic) curve for predictions of a binary outcome.

Usage

```
plotPrediction(
        param,
        outcome,
        forecast,
        cpgs2use,
        main,
        dfFull = NULL)
```

plotCVcors(cl, param)

plotROC(outcome, forecast)

Arguments

param	List of parameters as described in the "RW6_param.Rmd" vignette. Try: vignette("RW6_param", "ramwas"). Only modeloutcome, cvnfolds and mmalpha elements are used.
outcome	Values of a phenotype. Must be binary for plotROC.
forecast	Predictions for the phenotype.
cpgs2use	Number of variables used for prediction (for the legend).
main	Part of the title (summary stats are added beneath).
dfFull	Number of degrees of freedom for the significance testing. Default is: length(forecast) -2
cl	List with three elements:
	 x - vector with the number of variables used for prediction corp - Pearson correlations between the predictions and the true value of the phenotype. cors - Spearman correlations between the predictions and the true value of the phenotype.

Details

The plotROC and plot has no title. To add a title use title.

Value

The plotROC returns the area under the curve (AUC) for the ROC. The plotPrediction function returns the list of calculated statistics printed in the title. The plotCVcors returns nothing (NULL).

        main)
# Artificial data for plotCVcors()
cl = list(
         c(50, 100, 200, 500, 1000),
    x =
    corp = c(0.1, 0.6, 0.7, 0.85, 0.8),
    cors = c(0.1, 0.6, 0.7, 0.85, 0.8) + rnorm(5)*0.1)
# Plot prediction performance by the number of markers
plotCVcors(cl, param)
# Make the outcome binary for ROC plot
outcome = (outcome > 50)
# Plot ROC curve and calculate the AUC
plotROC(outcome, forecast)
```

plotFragmentSizeDistributionEstimate Estimate and plot Fragment Size Distribution.

Description

RaMWAS functions for estimation and plotting of the fragment size distribution.

Usage

```
estimateFragmentSizeDistribution(frdata, seqLength)
plotFragmentSizeDistributionEstimate(
    frdata,
    estimate,
    col1 = "blue",
    col2 = "red")
```

Arguments

frdata	Distribution of distances from the starts of isolated reads to the respective CpGs.
seqLength	The length of sequenced part of the fragments. The fragments are assument to not be smaller than seqLength.
estimate	Fragment size distribution estimate.
col1	Color of frdata points.
col2	Color of estimate curve.

Value

The function estimateFragmentSizeDistribution returns the estimate of the fragment size distribution.

Note

If the length of frdata is equal to seqLength, the fragments are assumed to all be of length seqLength.

Examples

```
# Simulate data
x = 0:250
truemean = 1 - pnorm(x, mean = 150, sd = 50)
frdata = rpois(n = length(x), lambda = truemean*300)
# Estimate fragment size distribution
estimate = estimateFragmentSizeDistribution(frdata, seqLength = 50)
# Plot fragment size distribution estimate
plotFragmentSizeDistributionEstimate(frdata, estimate)
```

plotPC

Plot Principal component (PC) Values (variation explained) and PC vectors (loadings)

Description

The function plotPCvalues plots PC values (variation explained). The function plotPCvectors plots PC vectors (loadings).

Usage

```
plotPCvalues(values, n = 40, ylim = NULL, col = "blue")
plotPCvectors(eigenvector, i, col = "blue1")
```

Arguments

values	Vector of PC values.
n	Number of top PCs to plot.
ylim	Numeric vectors of length 2, giving the y coordinate range. Exactly as in Plot- ting Parameters.
col	Color of the plotted points.
eigenvector	The i-th eigenvector. See eigen.
i	Indicates loadings of which PC to plot.

Value

This function creates a PC plot and returns nothing (NULL).

```

```
# Plot PC vectors
plotPCvectors(e$vectors[,1], 1)
plotPCvectors(e$vectors[,2], 2)
```

processCommandLine Scan Parameters From Command Line

Description

The pipeline parameters can be provided via command line.

For example:

R pipeline.r dirproject="/project" maxrepeats=0 modeloutcome="Age"

Each command line argument is treated as an R statement.

All variables defined this way are collected in a list which is returned.

Usage

```
processCommandLine(.arg = NULL)
```

Arguments

.arg

Vector of command line parameters. Obtained from commandArgs if omitted.

Details

If a command line argument defines variable "fileparam", it is assumed to be a filename, and the file with this name is scanned for extra pipeline parameters, as by parametersFromFile.

Value

Returns the list with all the variables set by the statement in the command line.

Note

Variables with names starting with period (.) are ignored.

pvalue2qvalue

Examples

```
filename = tempfile()
# Assume command line with two components:
# dirproject="."
# modelcovariates=c("Age","Sex")
arg = c(
    "dirproject = \".\"",
    "modelcovariates = c(\"Age\",\"Sex\")")
# Process the command line
param = processCommandLine(arg)
# Show the list
print(param)
```

pvalue2qvalue

Calculate Benjamini-Hochberg q-values

Description

Calculate Benjamini-Hochberg q-values for a vector of p-values.

Usage

pvalue2qvalue(pv, n = length(pv))

Arguments

pv	Vector of p-values.
n	If pv has only top p-values from a bigger set, n should indicate the number of tests performed.

Details

The q-values can be slightly conservative compared to other popular q-value calculation methods.

Value

Return a vector of q-values matching p-values in pv.

Note

The function runs faster if the vector pv is sorted.

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

Examples

```
pv = runif(20)^2
```

```
qv = pvalue2qvalue(pv)
```

QCs

Quality Control Measures

Description

RaMWAS calculates a number of QC measures for each BAM and saves them in R .rds files.

For full description of the QC measures and the ploting options run vignette("RW3_BAM_QCs")

Usage

```
qcmean(x)
## S3 method for class 'NULL'
qcmean(x)
## S3 method for class 'gcChrX'
qcmean(x)
## S3 method for class 'qcChrY'
qcmean(x)
## S3 method for class 'qcCoverageByDensity'
qcmean(x)
## S3 method for class 'qcEditDist'
qcmean(x)
## S3 method for class 'qcEditDistBF'
qcmean(x)
## S3 method for class 'qcFrwrev'
qcmean(x)
## S3 method for class 'qcHistScore'
qcmean(x)
## S3 method for class 'qcHistScoreBF'
qcmean(x)
## S3 method for class 'qcIsoDist'
qcmean(x)
## S3 method for class 'qcLengthMatched'
qcmean(x)
## S3 method for class 'qcLengthMatchedBF'
qcmean(x)
## S3 method for class 'qcNonCpGreads'
qcmean(x)
## S3 method for class 'qcHistScore'
plot(x, samplename="", xstep = 25, ...)
## S3 method for class 'qcHistScoreBF'
plot(x, samplename="", xstep = 25, ...)
## S3 method for class 'qcEditDist'
plot(x, samplename="", xstep = 5, ...)
```

QCs

```
## S3 method for class 'qcEditDistBF'
plot(x, samplename="", xstep = 5, ...)
## S3 method for class 'qcLengthMatched'
plot(x, samplename="", xstep = 25, ...)
## S3 method for class 'qcLengthMatchedBF'
plot(x, samplename="", xstep = 25, ...)
## S3 method for class 'qcIsoDist'
plot(x, samplename="", xstep = 25, ...)
## S3 method for class 'qcCoverageByDensity'
plot(x, samplename="", ...)
```

Arguments

x	The QC object. See the examples below.
samplename	Name of the sample for plot title.
xstep	The distance between x axis ticks.
	Parameters passed to the underlying plot or barplot function.

Value

Function qcmean returns one value summary of most QC measures. Run vignette("RW3_BAM_QCs") for description of values returned by it.

```

```
qqPlotFast
```

Fast QQ-plot for Large Number of P-values

Description

Function qqPlotFast creates a QQ-plot with a confidence band and an estimate of inflation factor lambda. It optimized to work quickly even for tens of millions of p-values.

Usage

```
qqPlotPrepare(
        pvalues,
        ntests = NULL,
        ismlog10 = FALSE)
qqPlotFast(
        х,
        ntests = NULL,
        ismlog10 = FALSE,
        ci.level = 0.05,
        ylim = NULL,
        newplot = TRUE,
        col = "#D94D4C",
        cex = 0.5,
        yaxmax = NULL,
        1wd = 3,
        axistep = 2,
        col.band = "#ECA538",
        makelegend = TRUE,
        xlab = expression(
            paste("\u2013", " log"[10]*"(", italic("P"), "), null")),
        ylab = expression(
            paste("\u2013", " log"[10]*"(", italic("P"), "), observed")))
```

Arguments

pvalues	Vector of p-values. As is (if ismlog10 = FALSE) or minus log10 transformed (if ismlog10 = TRUE).
ntests	If only significant p-values are provided, the total number of tests performed. By default ntests is equal to the length of pvalues.
ismlog10	Specifies whether the provides p-values (pvalues parameter) are minus log10 transformed (-log10(pv))
x	Either a vector of p-values, as in qqPlotPrepare, or the object returned by qqPlotPrepare.
ci.level	Significance level of the confidence band. Set to NULL avoid plotting the confidence band.

ylim	Numeric vectors of length 2, giving the y coordinate range. Exactly as in Plot ting Parameters.
newplot	If TRUE, the function creates a new plot window.
col	The QQ-plot curve color.
col.band	Confidence band curve color.
cex	The size of QQ-plot points. As in Graphics Parameters.
lwd	The line width. As in Graphics Parameters.
axistep	Distance between axis label ticks for both axis.
yaxmax	Maximum reach of the y axis.
makelegend	If true, add legend to the plot.
xlab,ylab	Axis labels. As in plot function.

Details

The function qqPlotFast creates a QQ-plot. The function qqPlotPrepare extracts the necessary information from a vector of p-values sufficient for creating QQ-plot. The resulting object is many times smaller than the vector of p-values.

Value

The function qqPlotPrepare returns an object with the necessary information from a vector of p-values sufficient for creating QQ-plot.

Note

The plot has no title. To add a title use title.

Note

The function works faster if the p-values are sorted.

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

# Size of the QQ-plot info object
object.size(qq)
# Create QQ-plot, it is the same
qqPlotFast(qq)
# Create QQ-plot with plotting parameters
qqPlotFast(qq, ylim = c(0,10), yaxmax = 9, axistep = 3, lwd = 3, cex = 1)
```

```
ramwas0createArtificialData
```

Create Artificial Data Set

Description

Creates a set of artificial BAM files and supplementary files which can be used to test run the pipeline. The BAMs contain reads aligned only to one human chromosome, with methylation effects embedded for simulated age and case-control status.

Usage

```
ramwas0createArtificialData(dir,
```

```
nsamples = 20,
nreads = 1e6,
ncpgs = 500e3,
randseed = 18090212,
threads = 1)
```

Arguments

dir	Directory for generated RaMWAS project files and BAMs.
nsamples	Number of samples/BAMs to create.
nreads	Number of reads in each BAM file.
ncpgs	Number of CpGs in the generated genome (with a single chromosome).
randseed	Random number generator seed for consistency of the output.
threads	Number of CPU cores to use for data generation.

Details

The function generates a number of files within dir directory.

1. bam_list.txt - list of created BAM files. To be used in filebamlist and filebam2sample parameters in the pipeline.

- 2. covariates.txt table with age and sex status covariates. For use in filecovariates parameter in the pipeline.
- 3. Single_chromosome.rds CpG location file with the selected chromosome only.
- 4. bams directory with all the BAM files.

The generated BAMs have 600 CpGs affected by sex, namely fully methylated or not methylated at all, depending on sex. The methylation level of 1% of all CpGs is affected by age. The methylation of those CpGs is equal to age/100 or 1-age/100. The age is generated randomly in the range from 20 to 80.

Value

The function creates multiple files but returns no value.

# The generated files are:"
as.matrix(list.files(dr, recursive=TRUE))
### Clean up
unlink(paste0(dr,"/*"), recursive=TRUE)
```

ramwasAnnotateLocations

Extract Biomart Annotation for a Vector of Locations.

Description

Calls biomart annotation database for a vector of locations and assignes the tracks to the locations.

Usage

```
ramwasAnnotateLocations(param, chr, pos)
```

Arguments

param	List of parameters as described in the "RW6_param.Rmd" vignette. Try: vignette("RW6_param", "ramwas").
chr	A vector of chromosome names or numbers.
pos	A vector of genomic locations on the chromosomes.

Details

This function is used internally by RaMWAS annotation step.

Value

An annotation table, on line per supplied location.

ramwasParameters

Description

RaMWAS parameter vector which is used by major functions of the pipeline is a regular R list and setting it does not require a special function. However, using this function makes it much simpler in RStudio as the names and role of every parameter is showed in the RStudio IDE.

Usage

```
ramwasParameters(
    dirproject,
   dirfilter,
   dirrbam,
   dirrqc,
   dirqc,
   dircoveragenorm,
   dirtemp,
   dirpca,
   dirmwas,
   dircv,
   dirbam,
    filebamlist,
   bamnames,
    filebam2sample,
   bam2sample,
    filecpgset,
    filenoncpgset,
    filecovariates,
    covariates,
    cputhreads,
    diskthreads,
   usefilelock,
    scoretag,
   minscore,
   maxrepeats,
   minavgcpgcoverage,
   minnonzerosamples,
   buffersize,
    doublesize,
   modelcovariates,
   modeloutcome,
   modelPCs,
   modelhasconstant,
    qqplottitle,
    toppvthreshold,
   mmncpgs,
   mmalpha,
    cvnfolds,
   bihost,
```

ramwasParameters

bimart, bidataset, biattributes, bifilters, biflank, fileSNPs, dirSNPs, ...)

Arguments

dirproject	The project directory. Default is currect directory. Files specified by "file*" parameters are looked for here, unless they have full path specified.
dirfilter	By default, the same as "dirproject". All files created by RaMWAS are created within this directory. If the user wants to test different read filtering rules, they can dirfilter to TRUE. This will set it to something like "Filter_MAPQ_4", there "MAPQ" is the BAM field used for filtering and "4" is the thredhold.
dirrbam	Directory where RaMWAS saves RaMWAS raw data files (read start locations) after scanning BAMs. It is "rds_rbam" by default and located in "dirfilter".
dirrqc	Directory where RaMWAS saves QC files in R format after scanning BAMs. It is "rds_qc" by default and located in "dirfilter".
dirqc	Directory where RaMWAS saves QC plots and text files (BAM QC info) after scanning BAMs. It is "qc" by default and located in "dirfilter".
dircoverageno	rm
	Directory where RaMWAS saves coverage matrix at Step 3 of the pipeline. It is "coverage_norm_123" by default (123 is the number of samples) and lo- cated in "dirfilter".
dirtemp	Directory where RaMWAS stores temporary files during construction of coverage matrix at Step 3 of the pipeline.It is "temp" by default and located in "dircoveragenorm".For better performance it can be set to a location on a different hard drive than "dircoveragenorm".
dirpca	Directory where RaMWAS saves results of PCA analysis at Step 4 of the pipeline. It is "PCA_12_cvrts_0b0a0c" by default and located in "dircoveragenorm", where 12 is the number of covariates regressed out and "0b0a0c" is a unique code to differenciate different sets of 12 covariates.
dirmwas	Directory where RaMWAS saves results of MWAS analysis at Step 5 of the pipeline. It is "Testing_age_7_PCs" by default and located in "dirpca", where "age" is the phenotype being tested and "7" is number of top PCs included in the model.
dircv	Directory where RaMWAS saves results of Methylation Risk Score analysis at Step 7 of the pipeline. It is "CV_10_folds" by default and located in "dirmwas", where 10 is number of folds in N-fold cross validation.
dirbam	Location of BAM files. If not absolute, it is considered to be relative to "dirproject".

filebamlist	If defined, must point to a text file with one BAM file name per line. BAM file names may include path, relative to "dirbam" or absolute.
bamnames	A character vector with BAM file names. Not required if "filebamlist" is specified. BAM file names may include path, relative to "dirbam" or absolute.
filebam2sample	Allowes multiple BAMs contain information about common sample. Must point to a file with lines like "sample1=bam1,bam2,bam3".
bam2sample	Allowes multiple BAMs contain information about common sample. Not required if "filebam2sample" is specified. Must be a list like list(sample1 = c("bam1", "bam2", "bam3"), sample2 = "bam2")
filecpgset	Name of the file storing a set of CpGs.
filenoncpgset	If defined, must point to a file storing vetted locations away from any CpGs.
filecovariates	Name of the file containing phenotype and covariates for the available samples. If the file has extension ".csv", it is assumed to be comma separated, otherwise - tab separated.
covariates	Data frame with phenotype and covariates for the available samples. Not required if "filecovariates" is specified.
cputhreads	Maximum number of CPU intensive tasks running in parallel. Set to the number of CPU cores by default.
diskthreads	Maximum number of disk intensive tasks running in parallel. Set to 2 by default.
usefilelock	If TRUE, parallel jobs are prevented from simultaneous access to file matrices. Can improve performance on some systems.
scoretag	Reads from BAM files are filtered by this tag. The "minscore" parameter defines the minimum admissible score.
minscore	Reads from BAM files with score "scoretag" below this are excluded.
maxrepeats	Duplicate reads (reads with the same start position and direction) in excess of this limit are removed.
minavgcpgcovera	age CpGs with average coverage below this threshold are removed.
minnonzerosamp	
F	CpGs with fraction of samples with non-zero coverage below this threshold are removed.
buffersize	Coverage matrix transposition is performed using buffers of this size. Larger "buffersize" improves speed of Step 3 of the pipeline, but requires more memory. Default is 1e9, i.e. 1 GB.
doublesize	The coverage matrix is stored with this number of bytes per value. Set to 8 for full (double) precision.
	Set to 4 to use single precision and create 50% smaller coverage filematrix.
modelcovariates	s Names of covariates included in PCA and MWAS.
modeloutcome	Name of the outcome variable for MWAS.
modelPCs	Number of principal components accounted for in MWAS.
modelhasconstar	
	By default, the tested linear model includes a constant. To exclude it, set "modelhasconstant" parameter to FALSE.

qqplottitle	The title of the QQ-plot produced by MWAS (step 4 of the pipeline).
toppvthreshold	Determines the number of top MWAS results saved in text file. If it is 1 or smaller, it defines the p-value threshold. If larger than 1, it defines the exact number of top results.
mmncpgs	Parameter for multi-marker elastic net cross validation (MRS). Defines the number of top CpGs on which to train the elastic net. Can be set of a vector of multiple values, each is tested separately.
mmalpha	Parameter for multi-marker elastic net cross validation (MRS). Elastic net mixing parameter alpha. Set to 0 by default.
cvnfolds	Parameter for multi-marker elastic net cross validation (MRS). The number of folds in the N-fold cross validation.
bihost	Parameter for BiomaRt annotation (Step 6 of the pipeline). BioMart host site. Set to "grch37.ensembl.org" by default.
bimart	Parameter for BiomaRt annotation (Step 6 of the pipeline). BioMart database name, see listMarts. Set to "ENSEMBL_MART_ENSEMBL" by default.
bidataset	Parameter for BiomaRt annotation (Step 6 of the pipeline). BioMart data set, see listDatasets. Set to "hsapiens_gene_ensembl" by default.
biattributes	Parameter for BiomaRt annotation (Step 6 of the pipeline). BioMart attributes of interest, see listAttributes. Set to c("hgnc_symbol", "entrezgene", "strand") by default.
bifilters	Parameter for BiomaRt annotation (Step 6 of the pipeline). BioMart filters (if any), see listFilters. Set to list(with_hgnc_transcript_name=TRUE) by default ignore genes with- out names.
biflank	Parameter for BiomaRt annotation (Step 6 of the pipeline). Allowed distance between CpGs and genes or other annotation track elements. Set to 0 by default, requiring direct overlap.
fileSNPs	Name of the filematrix with genotype (SNP) data. The filematrix dimensions must match the coverage matrix.
dirSNPs	Directory where RaMWAS saves the results of joint methylation-genotype analysis.
	Any other named parameters can be added here.

Details

The function simply collects all the parameters in a list. The main benefit of the function is that the user does not need to memorize the names of RaMWAS parameters.

ramwasParameters(
<pre>cputhreads =</pre>	^	cputhreads
		Maximum number of CPU intensive tasks running in parallel.

Form Row and Column Sums of Squares

Description

Form row and column sums of squares for numeric matrices. The functions are introduced as faster analogs of rowSums(x^2) and colSums(x^2) calls.

Usage

rowSumsSq(x)
colSumsSq(x)

Arguments

x Numeric matrix.

Details

The function is implemented in C for better performance.

Value

Return a vector of sums of values in each row/column for matrix x (rowSumsSq/colSumsSq).

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

See Also

See rowSums and colSums for simple (not squared) row/column sums.

rwDataClass-class

Examples

```
x = matrix( 1:99, 9, 11)
# Calculate sums of squared elements in each row
rsum2 = rowSumsSq(x)
# Compare with alternative calculation
stopifnot( all.equal( rsum2, rowSums(x^2) ))
# Calculate sums of squared elements in each column
csum2 = colSumsSq(x)
# Compare with alternative calculation
stopifnot( all.equal( csum2, colSums(x^2) ))
```

rwDataClass-class Class for Accessing Data (Coverage) Matrix

Description

This class is a wrapper for accessing the data (coverage) matrix. It automatically subsets the samples to those listed in the covariates. Data access function imputes missing values and can residualize the variables.

Extends

rwDataClass is a reference classes (see envRefClass).

Fields

fmdata: Filematrix object for the data matrix.

Not intended to be accessed directly. samplenames: Vector of sample names.

nsamples: Number of samples

ncpgs: Number of variables (CpG sites) in the data matrix.

ndatarows: Number of variables in the data matrix (may be bigger than the number of samples).

rowsubset: Indices of samples in the data matrix.

cvrtqr: Matrix of orthonormalized covariates.

Methods

- - 'getPCs' indicates if the covariate set should include Principal components.

'lockfile' is the 'lockfile' parameter used in accessing the data filematrix.

open(param = NULL, getPCs = TRUE, lockfile = NULL): The same as 'initialize' method, but for already created object.

close(): Clears the object. Closes the filematrix.

getDataRez(colset, resid = TRUE): Extracts data for variables indexed by 'colset'.

The data is residualized unless resid = FALSE.

subsetData

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

See Also

See vignettes: browseVignettes("ramwas")

Examples

```
# Create an empty rwDataClass
data = new("rwDataClass")
## Not run:
# Connect to the data
data$open(param)
# Create a rwDataClass and connect to the data
data = new("rwDataClass", param = param)
# close the object
data$close()
## End(Not run)
```

subsetData

```
Subset a data matrix and locations
```

Description

Subset a data (coverage) matrix and corresponding matrix of locations to a specified set of locations.

Usage

```
subsetCoverageDirByLocation(x, chr, start, targetdir)
```

Arguments

x	Name of data (coverage) directory or list of RaMWAS parameters as described in the "RW6_param.Rmd" vignette. Try: vignette("RW6_param", "ramwas").
chr	Vector of chromosome names or numbers.
start	Start positions of the CpGs of interest.
targetdir	Directory name for the new (subset) data matrix and locations.

Value

The function returns nothing.

Author(s)

Andrey A Shabalin <andrey.shabalin@gmail.com>

testPhenotype

See Also

See vignettes: browseVignettes("ramwas").

Examples

```
x = "/data/myCoverageMatrix"
chr = c("chr1", "chr2", "chr3")
start = c(12345, 123, 12)
targetdir = "/data/subsetCoverageMatrix"
## Not run:
subsetCoverageDirByLocation(x, chr, start, targetdir)
## End(Not run)
```

testPhenotype

Test the Phenotype of Interest for Association with Methylation Coverage.

Description

An internal, function for fast association testing. It tests the phenotype of interest for association with methylation coverage (columns of the data parameter).

Usage

testPhenotype(phenotype, data1, cvrtqr)

Arguments

phenotype	Vector with phenotype. Can be numerical, character, or factor vector.
data1	Matrix with data (normalized coverage), one variable (CpG) per column.
cvrtqr	Orthonormalized covariates, one covariate per column. See orthonormalizeCovariates.

Details

The testing is performed using matrix operations and C/C++ code, emplying an approach similar to that in **MatrixEQTL**.

Value

If the phenotype is numerical, the output is a list with

correlation	Correlations between residualized phenotype and data columns.
tstat	Corresponding T-statistics
pvalue	Corresponding P-values
nVarTested	Always 1
dfFull	Number of degrees of freedom of the T-test

If the phenotype is a factor (or character)

Rsquared	R-squared for the residualized ANOVA F-test.
Fstat	Corresponding F-test
pvalue	Corresponding P-values
nVarTested	First number of degrees of freedom for the F-test. Equal to the number of factor levels reduced by 1
dfFull	Second number of degrees of freedom for the F-test.

Note

This function is used in several parts of the pipeline.

See Also

See vignettes: browseVignettes("ramwas"). Also check orthonormalizeCovariates.

Examples

```
### Generate data inputs
# Random data matrix with signal in the first column
data = matrix(runif(30*5), nrow = 30, ncol = 5)
data[,1] = data[,1] + rep(0:2, each = 10)
```

```
# Two random covariates
cvrt = matrix(runif(2*30), nrow = 30, ncol = 2)
cvrtqr = orthonormalizeCovariates(cvrt)
```

```
### First, illustrate with numerical phenotype
# Numerical, 3 value phenotype
phenotype = rep(1:3, each = 10)
```

```
# Test for association
output = testPhenotype(phenotype, data, cvrtqr)
```

```
# Show the results
print(output)
```

Comparing with standard R code for the first variable summary(lm(data[,1] ~ phenotype + cvrt))

```
### First, illustrate with numerical phenotype
# Categorical, 3 group phenotype
phenotype = rep(c("Normal", "Sick", "Dead"), each = 10)
```

```
# Test for association
output = testPhenotype(phenotype, data, cvrtqr)
```

testPhenotype

Show the results
print(output)

Comparing with standard R code for the first variable anova(lm(data[,1] ~ cvrt + phenotype))
