aggregatorList-class

Class "aggregatorList"

## Description

A list of qaAggregators

#### **Details**

This class directly extends class "list" and is intended to exclusively hold objects of class qaAggregator, where each list item represents the outcome of a QA subprocess for a single flowFrame. It mainly exists to allow for method dispatch and should never be populated manualy; instead, use the constructor qaAggregatorList which checks for valid objects.

## **Objects from the Class**

Objects should be created using the constructor:

 $\label{eq:aggregatorList} \mbox{aggregator List (...), where ... are objects inheriting form class $qaAggregator or a$ list of such objects.}$ 

#### **Slots**

```
.Data: Object of class "list", the list data
```

## **Extends**

```
Class "list", from data part. Class "vector", by class "list", distance 2.
```

## Methods

```
initialize signature(.Object = "aggregatorList"): constructor
show signature(object = "aggregatorList"): print object details
```

## Author(s)

Florian Hahne

#### See Also

```

```

```
binaryAggregator-class
```

Class "binaryAggregator"

## **Description**

Abstraction of a binary type of aggregator with possible states "passed" and "not passed"

## **Objects from the Class**

Objects can be created by calls of the form new ("binaryAggregator", ...), or using the constructor binaryAggregator (passed), where passed is a logical scalar.

#### **Slots**

passed: Object of class "logical" indicating whether the process has passed the QA requirements

## Extends

Class qaAggregator, directly.

#### Methods

## Author(s)

Florian Hahne

#### See Also

qaProcess.marginevents,qaReport,qaProcess,qaProcess.timeline,discreteAggregator,factorAggregator,numericAggregator,stringAggregator,rangeAggregator

```
showClass("binaryAggregator")
```

## **Description**

Abstraction of a discrete type of aggregator with possible states "passed", "not passed" and "warning"

## **Objects from the Class**

Objects can be created by calls of the form new("discreteAggregator", ...) or using the constructor discreteAggregator(x), where x is an integer value in [0,1,2] or a factor with levels 0, 1 and 2.

#### **Slots**

```
x: Object of class "factor" One in 0 (not passes), 1 (passed) or 2 (warning)
passed: Object of class "logical" indicating whether the process has passed the QA requirements (not eveluated)
```

#### Extends

Class qaAggregator, directly.

#### Methods

```
show signature(object = "discreteAggregator"): print object details
writeLines signature(text = "discreteAggregator", con = "file", sep =
    "missing", useBytes="missing"): write to HTML file connection
```

#### Author(s)

4 evaluateProcess

evaluateProcess

Evaluate QA processes

#### **Description**

Re-evaluate an object of class qaProcess, e.g. for the case that a threshold value has changed.

## Usage

```
evaluateProcess (process, thresh, ...)
```

## Arguments

process An object of class qaProcess.

thresh The new treshold on which the process is to be evaluated.

... Further arguments that are passed on to the individual functions for each QA process type.

## **Details**

It is sometimes useful to update the state of aggregators in a qaProcess, for instances after changing the threshold value, without having to recompute all images, which can be very time consuming.

#### Value

An updated object of class qaProcess

#### Note

This function needs to be extended for new types of gaProcess.

## Author(s)

Florian Hahne

factorAggregator-class 5

```
factorAggregator-class
```

Class "factorAggregator"

#### **Description**

Abstraction of a factor type of aggregator with possible states coded by the factor levels

## **Objects from the Class**

Objects can be created by calls of the form new ("factorAggregator", ...) or using the constructor factorAggregator (x, passed), where x is a factor, or an object which can be coerced to a factor, and passed is a logical scalar.

#### **Slots**

```
x: Object of class "factor" coding the outcome state
passed: Object of class "logical" indicating whether the process has passed the QA requirements
```

#### **Extends**

```
Class "qaAggregator", directly.
```

6 flowQ-package

flowQ-package

Quality control for flow cytometry

## Description

Functions and methods for quality control and QA of flow cytometry data. This package heavily depends on the flowCore package.

## **Details**

Package: flowQ Type: Package Version: 0.2.1 Date: 2006-11-16 License: Artistic

Quality control is an important aspect when dealing with large amounts of complex high-throughput data. This package comprises functionality for efficient QA of flow cytometry data.

locateDuplicatedParameters

Locate Duplicated Parameters

## **Description**

Identifies dyes that are repeated arcross multiple flowSets using information provided in the description field of each flowFrame.

## Usage

locateDuplicatedParameters(flowList)

## **Arguments**

flowList A list of flowSet

## **Details**

This function is used internally by the qaProcess functions to identify dyes that are repeated across multiple aliquots. The function takes in a list of flowSet and identifies stains that are repeated across multiple flowSets (aliquots). These parameters are expected to have the same distribution across aliquots and can be used for Quality control. The method looks for the information provided in the description field of each flowFrame.

8 normailzeSets

#### Value

An object of class qaProcess.

#### Author(s)

Nishant Gopalakrishnan

## See Also

normalizeSets

normailzeSets

Locate Duplicated Parameters

## Description

Aligns up peaks for parameters across multiple flowSets using the warpSet method from the flowStats package.

#### Usage

normalizeSets(flowList,dupes,peaks=NULL)

## **Arguments**

flowList A list of flowSet

dupes Stains that are to be aligned across multiple flowSet

peaks Number of peaks expected in the distribution. If NULL is passed as input, The

number of peaks to align are estimated from the distribution

## **Details**

This function can be used to normalize dye information across multiple flowSets so that the peaks in the distributions align. The method makes use of information provided in the description field of each flowFrame to align up floursecense nformation from multiple flowSet.

## Value

A list of objects of class flowSet.

numericAggregator-class
```

Class "numericAggregator"

#### **Description**

Abstraction of a numeric type of aggregator for which possible states are coded by a numeric value

## **Objects from the Class**

Objects can be created by calls of the form new ("numericAggregator", ...) or using the constructor numericAggregator(x, passed), where x is a numeric scalar, and passed is a logical scalar.

#### **Slots**

```
x: Object of class "numeric" coding the outcome state.
```

passed: Object of class "logical" indicating whether the process has passed the QA requirements.

#### **Extends**

Class qaAggregator, directly.

```
preProcessFlowList Preprocess a list of flowSets to add empty flowFrames for patients in
```

## **Description**

The preProcessFlowList function takes in a list of flowSets as inputs and adds empty flowFrames for patients in which data from certain aliquots are missing. The function is to be used to modify datasets to conform to a format that can be utilized by the multiple sample gaProcess functions.

#### Usage

```
preProcessFlowList(flowList)
```

## **Arguments**

flowList A list of flowSet in which flowFrames for certain patients are missing

#### **Details**

This function can be used to modify a list of flowSets to fill in empty flowFrames for patients for which samples are missing.

#### Value

A list of objects of class flowSet.

12 qaAggregator-class

#### Author(s)

Nishant Gopalakrishnan

#### See Also

locateDuplicatedParameters

qData

Data for demonstrating QA processes that compares dye parameters from

## **Description**

A list of 8 flowSet. Each flowSet has data from four patients and each element in the list corresponds to an aliquot.

## Usage

data(qData)

#### **Format**

The object contains a list of 8 objects of class flowSet, each composed of 4 flowFrames. Each flowFrame correponds to a sample from an aliquot.

## **Details**

This qData dataset contains flouresence information for samples from four patients. The sample from each patient was separated into eight aliquots and each aliquot was stained using a different combination of dyes. For each patient, some dyes appear more than once in multiple alquots. These along with the Forward and Side scatter information can be used for Quality control.

qaAggregator-class Abstraction of the possible outcomes of a QA process

## **Description**

Virtual parent class for different types of QA aggregators

#### **Details**

In the context of this package, qaAggregators are objects that hold the outcome of a QA process. Each subclass implements its own writeLine method, which creates the appropriate HTML code for a graphical representation of the object.

## **Objects from the Class**

A virtual Class: No objects may be created from it.

qaGraph-class 13

#### **Slots**

passed: Object of class "logical" indicating whether the process has passed the QA requirements

#### Methods

No methods defined with class "qaAggregator" in the signature.

#### Author(s)

Florian Hahne

#### See Also

qaProcess.marginevents,qaReport,qaProcess,qaProcess.timeline,binaryAggregator,discreteAggregator,factorAggregator,numericAggregator,stringAggregator,rangeAggregator

#### **Examples**

```
showClass("qaAggregator")
```

qaGraph-class

Class "qaGraph"

#### **Description**

Abstraction of the graphical output created in the cause of a QA process

## **Objects from the Class**

Objects should be created using the constructor:

qaGraph (fileName, imageDir, width, empty=FALSE, pdf=TRUE), where fileName is a path to an image file, imageDir is the destination path for the images and the optional argument width is the final width to which the bitmap images are converted. The pdf argument controls wether vectorized versions of the image are to be produced. For the special case of an empty object without any images one can use option empty=TRUE, in which case the constructor ignores all other arguments.

During object instantiation the image file will be converted, resized and copied if necessary.

#### **Slots**

fileNames: Object of class "character" The paths to the image files, both the vectorized and unverctorized versions

dimensions: Object of class "matrix" The dimensions of the image files, both for the vectorized and unvectorized version

types: Object of class "character" The file extensions for both versions

id: Object of class "character" A unique identifier for the images

14 qaGraphList-class

#### Methods

```
initialize signature(.Object = "qaGraph"): constructor
names signature(x = "qaGraph"): returns the file name of the bitmap version of the image
show signature(object = "qaGraph"): print object details
```

## Author(s)

Florian Hahne

```

#### **Examples**

```
showClass("qaGraph")
```

```
qaGraphList-class Class "qaGraphList"
```

#### **Description**

A list of qaGraph objects

#### **Details**

This class directly extends class "list" and is intended to exclusively hold objects of class qaGraph, where each list item represents the grapical output of a QA subprocess for a single flowFrame. It mainly exists to allow for method dispatch and should never be populated manualy; instead, use the constructor qaGraphList which makes sure, that all image files are converted into the appropriate types and sizes and copied to the expected file location.

## **Objects from the Class**

Objects should be created using the constructor:

qaGraphList (imageFiles, imageDir, width, pdf=TRUE), where imageFiles are paths to image files, imageDir is the destination path for the images and width is the final width to which the bitmap images are converted. pdf can be used to toggle the generation of vectorized versions of the images.

## Slots

```

qaProcess-class

Abstraction of the results of a QA process

#### **Description**

QA processes create graphical output which can be bundled in a single HTML document. This class stores all information that is needed by writeQAReport to produce such HTML reports.

#### **Objects from the Class**

Objects should be created using the constructor functions. See qaProcess.timeline and qaProcess.marginevents for details. When writing new QA process functions, the constructors qaProcessFrame and qaProcess should be used. The latter expects the mandatory arguments id, type and frameProcesses and also accepts the optional arguments name and summaryGraph. See the vignette of this package for details.

## Slots

```
id: Object of class "character", the objects unique identifier
name: Object of class "character", the name of the process
type: Object of class "character", the type of process
frameIDs: Object of class "character", the identifiers of the flowSets to which the sub-
processes are linkes
summaryGraph: Object of class "qaGraph", a graphical summary of the processe's outcome
frameProcesses: Object of class "list", more detailed information for each flowFrame
```

## Methods

```
initialize signature(.Object = "qaProcess"): constructor
```

#### **Examples**

```
showClass("qaProcess")
```

```
qaProcess.2DStatsPlot
```

Creates a QA process for 2D summary statistic comparisons across

## Description

This function takes a list of flowSet as input and creates all necessary output for a '2DStatsPlot' type QA process. Objects created by this function can be laid out as HTML using writeQAReport.

## Usage

```
qaProcess.2DStatsPlot(flowList,dyes=c("FSC-A","SSC-A"),
  outdir="QAReport",thresh=0.25,func=mean,
  sum.dimensions=NULL,det.dimensions= NULL,pdf=TRUE,
  name="2DStats",...)
```

## **Arguments**

flowList	A list of flowSet	
dyes	Flow parameters to be compared across multiple samples	
outdir	The directory to which the graphical output is to be saved. If multiple QA processes are to be combined, make sure to use the same directory every time.	
thresh	A numeric value between 0 and 1 which is used as a threshold by the outlier detection algorithm	
func	Summary statistic function to be applied to each parameter in a $flowFrame$ (mean,median etc)	
sum.dimensions		
	The dimensions of summary plot generated in inches, default is NULL where the dimensions are automatically selected	
det.dimensions		
	the dimensions of each sub image generated by the QA process in inches, default is NULL where the dimensions are automatically selected.	
pdf	boolen value determinining if pdf files or jpeg images will be produced by the QA process	
name	The name of the process used for the headings in the HTML output.	
	Further arguments.	

#### **Details**

QA processes of type '2DStatsPlot' detects differences in the value of a summary statistic such as the mean, median etc across multiple samples.

For more details on how to layout qaProcess objects to HTML, see writeQAReport and qaReport.

#### Value

An object of class qaProcess.

#### Author(s)

Nishant Gopalakrishnan

#### See Also

```
writeQAReport, qaProcess, qaProcess.marginevents, qaProcess.DensityPlot,
qaProcess.ECDFPlot
```

## **Examples**

qaProcess.BoundaryPlot

Creates a QA process for comparison of the percentage of boundary

## Description

This function takes a list of flowSet as input and creates all necessary output for a 'BoundaryPlot' type QA process. Objects created by this function can be laid out as HTML using writeQAReport.

## Usage

```
qaProcess.BoundaryPlot(flowList,dyes=NULL,
  outdir="QAReport",cutoff=3,sum.dimensions=NULL,
  det.dimensions=NULL,pdf=TRUE,name="Boundary",
  side="both",...)
```

## **Arguments**

flowList	A list of flowSet	
dyes	Flow parameters to be compared across multiple samples. If set to NULL, all parameters that are duplicated across the list of flowSet are identified and compared.	
outdir	The directory to which the graphical output is to be saved. If multiple QA processes are to be combined, make sure to use the same directory every time.	
cutoff	A numeric value for the percentage of boundary events that is used by the process to identify samples that failed the QA process	
sum.dimens	ions	
	The dimensions of summary plot generated in inches, default is NULL where the dimensions are automatically selected	
det.dimensions		
	the dimensions of each sub image generated by the QA process in inches, default is NULL where the dimensions are automatically selected.	
pdf	boolen value determinining if pdf files or jpeg images will be produced by the QA process	
name	The name of the process used for the headings in the HTML output.	
side	Object of class "character". The margin on which to evaluate the filter. Either upper for the upper margin or lower for the lower margin or both for both margins.	
• • •	Further arguments.	

## **Details**

QA processes of type 'BoundaryPlot' helps identify samples that have a large number of boundary events that must be removed by further gating before detailed analysis of the data.

For more details on how to layout qaProcess objects to HTML, see writeQAReport and qaReport.

## Value

An object of class qaProcess.

## **Description**

This function takes a list of flowSet as input and creates all necessary outputs for a 'DensityPlot' type QA process. Objects created by this function can be laid out as HTML using writeQAReport.

## Usage

## Arguments

	flowList	A list of flowSet	
	dyes	Flow parameters to be compared across multiple samples. If set to NULL, all parameters that are duplicated across the list of flowSet are identified and compared.	
	outdir	The directory to which the graphical output is to be saved. If multiple QA processes are to be combined, make sure to use the same directory every time.	
	alpha	Outlier mislabeling rate	
	absolute.value		
		If provided, the absolute.value is used for the outlier detection and the alpha argument is ignored. defualt is NULL	
	sum.dimensions		
		The dimensions of summary plot generated in inches, default is NULL where the dimensions are automatically selected	
det.dimensions			
		the dimensions of each sub image generated by the QA process in inches, default is NULL where the dimensions are automatically selected.	
	pdf	boolen value determinining if pdf files or jpeg images will be produced by the QA process	
	name	The name of the process used for the headings in the HTML output.	
		Further arguments.	

#### **Details**

QA processes of type 'DensityPlot' detects differences in the density plots across multiple samples. A summary measure based on the sum of the pairwise KL Distances of density plots is used as a parameter to flag patient panels that are potential outliers.

For more details on how to layout qaProcess objects to HTML, see writeQAReport and qaReport.

## Value

An object of class qaProcess.

Nishant Gopalakrishnan

#### See Also

```
writeQAReport,qaReport,qaProcess,qaProcess.marginevents,qaProcess.ECDFPlot,qaProcess.2DStatsPlot
```

## **Examples**

qaProcess.ECDFPlot Creates a QA process for comparisons of ECDF's across multiple samples

## Description

This function takes a list of flowSet as input and creates all necessary outputs for an 'ecd-fOutliers' type of QA process. Objects created by this function can be laid out as HTML using writeQAReport.

## Usage

```
qaProcess.ECDFPlot(flowList, dyes=NULL,outdir="QAReport",
    alpha=0.05, absolute.value=NULL,sum.dimensions=NULL,
    det.dimensions=NULL, pdf=TRUE,
    name="ECDF",...)
```

#### **Arguments**

flowList A list of flowSet

dyes Flow parameters to be compared across multiple samples. If set to NULL, all

parameters that are duplicated across the list of flowSet are identified and

compared.

outdir The directory to which the graphical output is to be saved. If multiple QA pro-

cesses are to be combined, make sure to use the same directory every time.

alpha Outlier mislabeling rate

absolute.value

If provided, the absolute.value is used for the outlier detection and the alpha

argument is ignored. defualt is NULL

sum.dimensions

The dimensions of summary plot generated in inches, default is NULL where the dimensions are automatically selected

qaProcess.KLDistPlot 21

det.dimensions

the dimensions of each sub image generated by the QA process in inches, default

is NULL where the dimensions are automatically selected.

pdf boolen value determining if pdf files or jpeg images will be produced by the

QA process

name The name of the process used for the headings in the HTML output.

... Further arguments.

#### **Details**

QA processes of type 'ECDFPLot' detects differences in the empirical cumulative distribution of flow parameters across multiple samples. A summary measure based on the sum of the pairwise KL Distances of ECDF plots across multiple samples is used as a parameter to flag patient panels that are potential outliers.

For more details on how to layout qaProcess objects to HTML, see writeQAReport and qaReport.

qaProcess.cellnumber 23

## **Examples**

```
qaProcess.cellnumber
```

Create QA process of type 'cellnumber'

## Description

This function takes a flowSet as input and creates all necessary output for a 'cellnumber' type QA process. Objects created by this function can be laid out as HTML using writeQAReport.

## Usage

## Arguments

set	A flowSet.	
grouping	A character vector defining one of the variables in the phenoData of set used as a grouping variable. If this argument is used and if absolute.value is NULL, outlier detection will be performed within groups rather than across all samples.	
outdir	The directory to which the graphical output is to be saved. If multiple QA processes are to be combined, make sure to use the same directory for all of them.	
cFactor	The outlier threshold at which the QA criterion is considered to have failed. This is essentially the factor of standard deviations away from the average number of cells per sample, either in both directions if two.sided=TRUE or only towards smaller event numbers if two.sided=FALSE.	
absolute.value		
	An absolute event count below which the QA criterion is considered to be failed. If this argument is not $\texttt{NULL}$ , $\texttt{cFactor}$ and $\texttt{two.sided}$ are ignored.	
two.sided	Perform a two-sided outlier detection, i.e., report both unproportionally high and low event numbers.	
name	The name of the process used for the headings in the HTML output.	
sum.dimensions		

The dimensions of the pdf deviced in inches used for the summary plot.

pdf

Logical indicating whether to create vectorized versions of images for this quality process. This should be set to FALSE if disk space is critical, since the pdf versions of the image consume much more space on the hard drive compared to the bitmap version.

... Further arguments.

#### **Details**

QA processes of type 'cellnumber' detect aberations in the number of events per sample. These are either determined dynamically as outliers from the typical distribution of event counts for the whole set, or, if absolute.value is not NULL, by an absolute cutoff value. If there is a natural grouping among the samples, this can be specified using the grouping argument. In this case, the outlier detection will be performed within its respective group for a particular sample.

For more details on how to layout qaProcess objects to HTML, see writeQAReport and qaReport.

#### Value

An object of class qaProcess.

```
qaProcess.marginevents
```

Create QA process of type 'marginevents'

## **Description**

This function takes a flowSet as input and creates all necessary output for a 'marginevents' type QA process. Objects created by this function can be laid out as HTML using writeQAReport.

qaProcess.marginevents 25

#### Usage

```
qaProcess.marginevents(set, channels=NULL, side ="both", grouping=NULL,
    outdir, cFactor=2, absolute.value=NULL, name="margin events",
    sum.dimensions=NULL, det.dimensions=c(3,1), pdf=TRUE, ...)
```

#### **Arguments**

A flowSet. set A character vector of channel names for which margin events are to be recorded. channels Will use all available channels except for the time channel if NULL. Object of class "character". The margin on which to evaluate the filter. side Either upper for the upper margin or lower for the lower margin or both for both margins. A character vector defining one of the variables in the phenoData of set used grouping as a grouping variable. If this argument is used and if absolute.value is NULL, outlier detection will be performed within groups rather than across all outdir The directory to which the graphical output is to be saved. If multiple QA processes are to be combined, make sure to use the same directory for all of them. cFactor The outlier threshold at which the OA criterion is considered to have failed. This is essentially the factor of standard deviations away from the average number of cells per sample for the respective channel. absolute.value An absolute percentage of margin events below which the QA criterion is considered to be failed. If this argument is not NULL, cFactor is ignored. The name of the process used for the headings in the HTML output. name sum.dimensions The dimensions of summary plot generated in inches, default is NULL where the dimensions are automatically selected

det.dimensions

the dimensions of each sub image generated by the QA process in inches.

pdf

Logical indicating whether to create vectorized versions of images for this quality process. This should be set to FALSE if disk space is critical, since the pdf versions of the image consume much more space on the hard drive compared to the bitmap version. Setting the argument to FALSE will also speed up the process.

... Further arguments.

#### **Details**

QA processes of type 'marginevents' record the number of events that fall on the margins of the measurement range for each channel. Unproportionally high numbers of such events can indicate problems with the instrument settings or with compensation. These are either determined dynamically as outliers from the typical distribution of margin event percentages for the whole set, or, if absolute.value is not NULL, by an absolute cutoff value. If there is a natural grouping among the samples, this can be specified using the grouping argument. In this case, the outlier detection will be performed within its respective group for a particular sample.

For more details on how to layout qaProcess objects to HTML, see writeQAReport and qaReport.

26 qaProcess.timeflow

#### Value

An object of class qaProcess.

#### Author(s)

Florian Hahne

## See Also

```
writeQAReport, qaProcess, qaProcess.timeline, qaProcess.timeflow,
qaProcess.cellnumber
```

## **Examples**

```
## Not run:
data(GvHD)
dest <- tempdir()
qp <- qaProcess.marginevents(GvHD, channels=c("FSC-H", "SSC-H"),
    outdir=dest)
qp
## End(Not run)</pre>
```

```
qaProcess.timeflow Create QA process of type 'timeflow'
```

## Description

This function takes a flowSet as input and creates all necessary output for a 'timeflow' type QA process. Objects created by this function can be laid out as HTML using writeQAReport.

## Usage

```
qaProcess.timeflow(set, outdir, cutoff=2, name="time flow",
sum.dimensions=NULL, det.dimensions=c(3,2), pdf=TRUE, ...)
```

## Arguments

set	A flowSet.
outdir	The directory to which the graphical output is to be saved. If multiple QA processes are to be combined, make sure to use the same directory for all of them.
cutoff	The threshold at which the QA criterion is considered to have failed. An absolute value in the timeline deviation score as computed by the timeLinePlot function.
name	The name of the process used for the headings in the HTML output.

qaProcess.timeline 27

```
sum.dimensions, det.dimensions
```

The dimensions of the pdf device in inches used for the summary and the detailed plots.

pdf

Logical indicating whether to create vectorized versions of images for this quality process. This should be set to FALSE if disk space is critical, since the pdf versions of the image consume much more space on the hard drive compared to the bitmap version.

... Further arguments.

#### **Details**

QA processes of type 'timeflow' detect disturbances in the flow of cells over time. These indicate problems with the cell suspension, clogging of the needle or similar issues. If the flow rate is to high, the frequency of measuring cell douplettes increases.

For more details on how to layout qaProcess objects to HTML, see writeQAReport and qaReport.

#### Value

An object of class gaProcess.

## Author(s)

Florian Hahne

#### See Also

writeQAReport, qaProcess, qaProcess.marginevents qaProcess.timeline,
qaProcess.cellnumber

## Examples

```
## Not run:
data(GvHD)
dest <- tempdir()
qp <- qaProcess.timeflow(GvHD, outdir=dest, cutoff=1)
qp
## End(Not run)</pre>
```

qaProcess.timeline Create QA process of type 'timeline'

## Description

This function takes a flowSet as input and creates all necessary output for a 'timeline' type QA process. Objects created by this function can be laid out as HTML using writeQAReport.

28 qaProcess.timeline

#### Usage

```
qaProcess.timeline(set, channels=NULL, outdir, cutoff=1,
  name="time line", sum.dimensions=NULL, det.dimensions=c(3,2),
  pdf=TRUE, ...)
```

## **Arguments**

set	A flowSet
channels	A character vector of channel names for which the qaReport is to be produced. Will use all available channels except for the time channel if $\mathtt{NULL}$ .
outdir	The directory to which the graphical output is to be saved. If multiple QA processes are to be combined, make sure to use the same directory for all of them.
cutoff	The threshold at which the QA criterion is considered to be failed. An absolute value in the timeline deviation score as computed by the timeLinePlot function.
name	The name of the process used for the headings in the HTML output.
sum.dimensio	The dimensions of the pdf device in inches used for the summary and the detailed plots.
pdf	Logical indicating whether to create vectorized versions of images for this quality process. This should be set to FALSE if disk space is critical, since the pdf versions of the image consume much more space on the hard drive compared to the bitmap version.
	Further arguments.

## **Details**

QA processes of type 'timeline' detect unusal patterns in the acquisition of fluorescense and light scatter measurements over time. These are detected dynamically by identifying trends in the signal intensity over time or local changes in the measurement intensities. The underlying hypothesis is that measurement values are acquired randomly, hence there shouldn't be any correlation to time.

For more details on how to layout qaProcess objects to HTML, see writeQAReport and qaReport.

#### Value

An object of class qaProcess.

#### Author(s)

Florian Hahne

qaProcessFrame-class 29

#### **Examples**

```
## Not run:
data(GvHD)
GvHD <- transform(GvHD, "FL1-H"=asinh(`FL1-H`), "FL2-H"=asinh(`FL2-H`))
dest <- tempdir()
qp <- qaProcess.timeline(GvHD, channel="FL1-H", outdir=dest, cutoff=1)
qp
## End(Not run)</pre>
```

qaProcessFrame-class

Class "qaProcessFrame"

#### **Description**

Abstraction of subitems within a qQA process

#### **Details**

This class bundles graphs and aggregators for a single flowFrame. This allows to create processes with subcomponents, where each item in the frameAggregators and frameGraphs lists corresponds to one subprocess, which can be used, for instance, to create individual plots for each flow channel. For QA processes without subcomponents, these slots would simply not be populated.

## **Objects from the Class**

Objects should be created using the constructor:

qaProcessFrame (frameID, summaryAggregator, summaryGraph, frameAggregators, frameGraphs, details) where frameID is the ID of the flowFrame the process is linked to, summaryAggregator is an object inheriting from class qaAggregator which summarizes the outcome, summaryGraph is an object of class qaGraph which is the overview graph of the process for the whole frame, details is a list containing any additional information regarding the QA process, frameAggregators is an object of class aggregatorList and frameGraphs is an object of class qaGraphList. The latter two are the collections of aggregators and graphs for each subprocess. Only frameID and summaryAggregator are mandatory arguments.

#### **Slots**

```
id: Object of class "character", a unique ID of the object
frameID: Object of class "character", ID of the flowFrame the process is linked to
summaryAggregator: Object of class "qaAggregator", an aggregator summarizing the
    output of the process
summaryGraph: Object of class "qaGraph", a graphical summary of the process
frameAggregators: Object of class "aggregatorList" a list of aggregators for the sub-
    processes
frameGraphs: Object of class "qaGraphList" a list of graphical summaries for the subpro-
    cesses
details: A list for any additional information
```

30 qaProcessSummary

#### Methods

```
initialize signature(.Object = "qaProcessFrame"):constructor
```

## Author(s)

Florian Hahne

#### See Also

```
qaGraphList, writeQAReport, qaProcess
```

## **Examples**

```
showClass("qaProcessFrame")
```

```
qaProcessSummary Class "qaProcessSummary"
```

## **Description**

An internal class to represent QA summaries

## **Objects from the Class**

The class is internal and not ment for interactive use.

## **Slots**

```
panels: Object of class "list"
ranges: Object of class "matrix"
summary: Object of class "list"
mapping: Object of class "list"
pnams: Object of class "character"
overallSum: Object of class "matrix"
```

#### Methods

```
writeLines signature(text = "qaGraphList", con = "file"): HTML output
show signature(object = "qaGraphList"): print object details
```

## Author(s)

Florian Hahne

qaReport 31

qaReport Create HTML report using one or several Q	A process function(s)
--	-----------------------

## **Description**

This function combines all graphical output of multiple QA process functions for one flowSet in a single hyperlinked HTML document.

## Usage

#### **Arguments**

set	A flowSet
qaFunctions	A character vector of the names of QA process functions to be used
outdir	The directory to which the HTML report is to be saved.
argLists	lists of argument lists for each of the QA process functions specified via ${\tt qaFunctions}$
grouping	A character scalar indicating a variable in the flowSet's phenoData that is used as a grouping factor in the output.
	Further arguments that are passed on to writeQAReport.

#### **Details**

This is a simple convenience function to produce HTML QA reports for a single flowSet given a list of QA process functions. For more fine-grained control use function writeQAReport directly.

An entry point to the output of this function can be found at outdir/index.html.

#### Value

The function is called for it's side effects

## Author(s)

Florian Hahne

## See Also

```
qaProcess.marginevents, writeQAReport, qaProcess, qaProcess.timeline
```

```
## Not run:
data(GvHD)
GvHD <- transform(GvHD, "FL1-H"=asinh(`FL1-H`), "FL2-H"=asinh(`FL2-H`))
dest <- tempdir()
qaReport(GvHD, c("qaProcess.timeline", "qaProcess.marginevents"), dest,
list(list(channel="FL1-H", cutoff=1), list(channels=c("FL1-H",
    "FL2-H"), cFactor=4)))</pre>
```

32 rangeAggregator-class

#### **Description**

Abstraction of a range type of aggregator where possible states are within certain ranges (e.g. percentages)

#### **Objects from the Class**

Objects can be created by calls of the form new("rangeAggregator", ...) or using the constructor rangeAggregator(x, min, max, passed), where x, min and max are numeric scalars, with x in the range of [min, max], and passed is a logical scalar.

## **Slots**

```
min: Object of class "numeric", the range minimum
max: Object of class "numeric", the range maximum
x: Object of class "numeric", the value within the range
passed: Object of class "logical" indicating whether the process has passed the QA requirements
```

## Extends

Class numericAggregator, directly. Class qaAggregator, by class "numericAggregator", distance 2.

#### Methods

```
show signature(object = "rangeAggregator"): print object details
writeLines signature(text = "rangeAggregator", con = "file", sep = "missing", useBy
="missing"): write to HTML file connection
```

#### Author(s)

Florian Hahne

```
showClass("rangeAggregator")
```

stringAggregator-class 33

## **Description**

Abstraction of a string type of aggregator for which possible states are indicated through a textual description

## **Objects from the Class**

Objects can be created by calls of the form new("stringAggregator", ...) or using the constructor stringAggregator(x, passed), where x is a character scalar, and passed is a logical scalar.

#### **Slots**

```
x: Object of class "character" which is a textual description of the outcome
passed: Object of class "logical" indicating whether the process has passed the QA requirements
```

#### **Extends**

```
Class "qaAggregator", directly.
```

## Methods

#### Author(s)

Florian Hahne

```

34 validProcess

txtFormatQAObject Formats results contained in QA process objects into a data frame with

## **Description**

Formats information contained in QA process objects into a data frame which can then be easly written to a tab delimited file. Information contained includes the values used in the outlier detection, information whether the particular parameter passed the outlier test and the summary aggregator information.

#### Usage

```
txtFormatQAObject(qp)
```

## **Arguments**

qp

A qaProcess object

#### Value

A data.frame containing the values used in outlier detection, thresholds used, information regarding whether the parameter passed/failed the test as well as the summary aggregator information

#### Author(s)

Nishant Gopalakrishnan

#### See Also

```
writeQATextReport
```

## **Examples**

validProcess

Validate a QAProcess object

## Description

Check for integrety and existence of files specified in a qaProcess object.

## Usage

```
validProcess(object)
```

writeQAReport 35

## **Arguments**

object A qaProcess object

## Value

The function is called for it's side effects.

## Author(s)

Florian Hahne

qaProcess.marginevents,qaReport,qaProcess,qaProcess.timeline,writeQAReport

writeQAReport

Create HTML report for (lists of) qaProcess objects

## Description

This function combines all graphical output of multiple QA processes for one or several  ${\tt flowSets}$  in a single hyperlinked HTML document.

## Usage

## **Arguments**

set	A flowSet or a list of several flowSets.
processes	A list of qaProcess objects or, in the case of multiple flowSets, a list of lists of qaProcess objects. See below for further details.
globalProces	ss
	A list of qaProcess objects generated by multipanel comparison qaProcess functions, when set is a list of $flowSets$ .
outdir	The directory to which the HTML report is to be saved. Each qaProcess object should have been created in the same directory.
grouping	A character scalar indicating a variable in the flowSet's phenoData that is used as a grouping factor in the output.
pagebreaks	A logical indicating whether the output should be on one long page, or split over several pages.
pdf	A logical indicating whether vectorized versions of the images should be included. Setting this to TRUE implies that the individual QA processes have also

been created with setting pdf=TRUE.

36 writeQATextReport

#### **Details**

Both the information about graphical output generated as part of a QA process as well as the qunatitative or qualitative results are stored in objects of class <code>qaProcess</code>. The creation of such objects is abstracted in dedicated constructor function and the user should call these functions directly rather than creating <code>qaProcess</code> manually. <code>writeQAReport</code> takes lists of such objects and combines their information in a unified HTML document. A grouping factor can be specified to indicate subgroups of the data. In the case of multiple panels, a list of <code>flowSets</code> can be given to <code>writeQAReport</code>, and the function expects a list of lists of processes, where each process list is specific to one panel.

An entry point to the output of this function can be found at outdir/index.html.

#### Value

The function is mostly called for it's side effects, that is, the generation of a HTML quality report in outdir. A URL to an entry point for browsing of the report is returned.

#### Author(s)

Florian Hahne

#### See Also

qaProcess.marginevents, qaReport, qaProcess, qaProcess.timeline

#### **Examples**

```
## Not run:
data(GvHD)
GvHD <- transform(GvHD, "FL1-H"=asinh(`FL1-H`), "FL2-H"=asinh(`FL2-H`))
dest <- tempdir()
qp1 <- qaProcess.timeline(GvHD, channel="FL1-H", outdir=dest, cutoff=1)
qp2 <- qaProcess.marginevents(GvHD, channels=c("FL1-H", "FL2-H"),
    outdir=dest, cFactor=4)
url <- writeQAReport(GvHD, processes=list(qp1, qp2), outdir=dest,
    grouping="Patient")
browseURL(url)
## End(Not run)</pre>
```

writeQATextReport Create tab delimited text files for (lists of) qaProcess objects

#### **Description**

This function combines all the results of multiple QA processes for one or several flowSets in a single tab delimited text document.

## Usage

writeQATextReport 37

#### **Arguments**

A flowSet or a list of several flowSets.

processes

A list of qaProcess objects or, in the case of multiple flowSets, a list of lists of qaProcess objects. See below for further details.

globalProcess

A list of qaProcess objects generated by multipanel comparison qaProcess functions, when set is a list of flowSets.

fileName

A character vector for the name of the file.

#### **Details**

Qunatitative or qualitative results are stored in objects of class qaProcess. writeQATextReport takes lists of such objects and combines their information in a tab delimited text document. In the case of multiple panels, a list of flowSets can be given to writeQAReport, and the function expects a list of lists of processes, where each process list is specific to one panel.

#### Value

The function is mostly called for it's side effects, that is, the generation of a tab delimited text file. .
